*Computational Psychometrics: New Methodologies for a New Generation of Digital Learning and Assessment* Alina A. von Davier, Robert J. Mislevy, Jiangang Hao, 2022-01-01 This book defines and describes a new discipline named computational psychometrics from the perspective of new methodologies for handling complex data from digital learning and assessment. The editors and the contributing authors discuss how new technology drastically increases the possibilities for the design and administration of learning and assessment systems and how doing so significantly increases the variety, velocity, and volume of the resulting data. Then they introduce methods and strategies to address the new challenges ranging from evidence identification and data modeling to the assessment and prediction of learners' performance in complex settings as in collaborative tasks, game simulation based tasks, and multimodal learning and assessment tasks. Computational psychometrics has thus been defined as a blend of theory based psychometrics and data driven approaches from machine learning, artificial intelligence, and data science. All these together provide a better methodological framework for analysing complex data from digital learning and assessments. The term computational has been widely adopted by many other areas as with computational statistics, computational linguistics, and computational economics. In those contexts, computational has a meaning similar to the one proposed in this book: a data driven and algorithm focused perspective on foundations and theoretical approaches established previously, now extended and when necessary reconceived. This interdisciplinarity is already a proven success in many disciplines from personalized medicine that uses computational statistics to personalized learning that uses well computational psychometrics. We expect that this volume will be of interest not just within but beyond the psychometric community. In this volume, experts in psychometrics, machine learning, artificial intelligence, data science, and natural language processing illustrate their work showing how the interdisciplinary expertise of each researcher blends into a coherent methodological framework to deal with complex data from complex virtual interfaces. In the chapters focusing on methodologies, the authors use real data examples to demonstrate how to implement the new methods in practice. The corresponding programming codes in R and Python have been included as snippets in the book and are also available in fuller form in the GitHub code repository that accompanies the book.

**Education** Harry J. Witchel, Michael W. Lee, 2022-06-24 This contributed volume focuses on understanding the educational strengths and weaknesses of mediated content including media as a learning supplement in comparison to traditional face to face learning. Each chapter includes research on and a broad brush summary of approaches to combining life sciences education with educational technologies. The chapters are organized into four main sections each of which focuses on a key question regarding the consequences of incorporating media into education. In this regard, the authors highlight how educational technology is both a bridge and barrier to student access and inclusivity. Further, they address the ongoing discussion as to whether students need to be present for lectures and on how having agency in their own learning can

improve both retention and conceptual understanding To link the content to current events the authors also shed light on the impact that the COVID 19 pandemic is having on the continuity of educational programs and on the growing importance of educational technologies Consequently the book offers life science educators valuable guidance on the technologies already available and an outlook on what is yet to come
