*Uniform Random Numbers* Shu Tezuka, 2012-12-06 In earlier forewords to the books in this series on Discrete Event Dynamic Systems DEDS we have dwelt on the pervasive nature of DEDS in our human made world From manufacturing plants to computer communication networks from traffic systems to command and control modern civilization cannot function without the smooth operation of such systems Yet mathematical tools for the analysis and synthesis of DEDS are nascent when compared to the well developed machinery of the continuous variable dynamic systems characterized by differential equations The performance evaluation tool of choice for DEDS is discrete

event simulation both on account of its generality and its explicit incorporation of randomness As it is well known to students of simulation the heart of the random event simulation is the uniform random number generator Not so well known to the practitioners are the philosophical and mathematical bases of generating random number sequence from deterministic algorithms This editor can still recall his own painful introduction to the issues during the early 80 s when he attempted to do the first perturbation analysis PA experiments on a personal computer which unbeknownst to him had a random number generator with a period of only 32 768 numbers It is no exaggeration to say that the development of PA was derailed for some time due to this ignorance of the fundamentals of random number generation
