This book focuses on database design and exposes students to a variety of approaches for getting the Data Model right. The book addresses issues related to database performance, Query Processing and Transaction Management for multi-user environments. This book also introduces non-relational XML format to students. The approach taken to teach the topics is through introduction of many real-world enterprise database case studies and practice problems. The case studies are selected based on modern application areas, keeping the student's interest in mind. The book provides hands-on experience of database design issues with several ready-made lab exercises. For grading students' understanding of the topics, several challenging assignments are also provided at the end of chapters. Multiple-choice self-tests are provided for formative assessment throughout the book. The book is suitable for the undergraduate students of Computer Science and Engineering, Information Technology, and students of Computer Applications, BCA, MCA. Key features: All the topics are illustrated with practical examples. Topics like Entity Relationship diagram, ERD, are discussed with Diagrams and Visual Aids. Students are exposed to the various approaches for determining data requirements. Structured Query Language (SQL) examples are worked with scripts, results, and solutions. Exclusive lab exercises on SQL can be used as assignments.
