The Craft of Model-Based Testing Paul C. Jorgensen,2017-05-08 In his latest work author Paul C Jorgensen takes his well honed craftsman s approach to mastering model based testing MBT To be expert at MBT a software tester has to understand it as a craft rather than an art This means a tester should have deep knowledge of the underlying subject and be well practiced in carrying out modeling and testing techniques Judgment is needed as well as an understanding of MBT the tools The first part of the book helps testers in developing that judgment It starts with an overview of MBT and follows with an in depth treatment of nine different testing models with a chapter dedicated to each model These chapters are tied together by a pair of examples a simple insurance premium calculation and an event driven system that describes a garage door controller The book shows how simpler models flowcharts decision tables and UML Activity charts express the important aspects of the insurance premium problem It also shows how transition based models finite state machines Petri nets and statecharts are necessary for the garage door controller but are overkill for the insurance premium problem Each chapter describes the extent to which a model can support MBT The second part of the book gives testers a greater understanding of MBT tools It examines six commercial MBT products presents the salient features of each product and demonstrates using the product on the insurance premium and the garage door controller problems These chapters each conclude with advice on implementing MBT in an organization The last chapter describes six Open Source tools to round out a tester s knowledge of MBT In addition the book supports the International Software Testing Qualifications Board s ISTQB MBT syllabus for certification *Spatial Modeling in Natural Sciences and Engineering* Jürgen Friedrich,2004-02-09 The author introduces the reader to the creation and implementation of space related models by applying a learning by doing and problem oriented approach The required procedural skills are rarely taught at universities and many scientists and engineers struggle to transfer a model into a computer program The purpose of this book is to fill this gap It moves from simple to more complex applications covering various important topics in the sequence dynamic matrix processing 2D and 3D graphics
