Research, Practice, and Innovations in Teacher Education During a Virtual Age Zimmerman, Aaron Samuel,2022-11-18 Decades of research have shown that early career teachers face a number of challenges and hold an increasingly wide set of responsibilities Teacher educators therefore must think carefully about how to prepare early career teachers for the profession Additionally however the work of teaching and teacher education has become increasingly complex within the context of the current virtual age including the prominent reality of social media and the significant possibilities of online teaching and learning *Research Practice and Innovations in Teacher Education During a Virtual Age* makes a significant contribution to the scholarship on teacher education by presenting a variety of evidence based methods that can be used to develop and improve aspects of teacher education within this virtual age including the curriculum and pedagogy of online teacher education as well as effective ways to prepare preservice teachers for the realities of online teaching and online learning Covering topics such as virtual caring learning material adaptation and instructional coaching this premier reference source is a dynamic resource for teacher educators pre service teachers administrators and educators of both K 12 and higher education government officials policymakers researchers and academicians *Remote Sensing of Precipitation* Silas Michaelides,2019-07-23 Precipitation is a well recognized pillar in global water and energy balances An accurate and timely understanding of its characteristics at the global regional and local scales is indispensable for a clearer understanding

of the mechanisms underlying the Earth's atmosphere-ocean complex system. Precipitation is one of the elements that is documented to be greatly affected by climate change. In its various forms, precipitation comprises a primary source of freshwater which is vital for the sustainability of almost all human activities. Its socio-economic significance is fundamental in managing this natural resource effectively in applications ranging from irrigation to industrial and household usage. Remote sensing of precipitation is pursued through a broad spectrum of continuously enriched and upgraded instrumentation embracing sensors which can be ground-based e.g. weather radars, satellite-borne e.g. passive or active space-borne sensors, underwater e.g. hydrophones, aerial or ship-borne.

Development of HfO₂-Based Ferroelectric Memories for Future CMOS Technology Nodes Stefan Ferdinand Müller, 2016-04-08

This thesis evaluates the viability of ferroelectric Si HfO₂ and its derived FeFET application for non-volatile data storage. At the beginning, the ferroelectric effect is explained briefly such that the applications that make use of it can be understood. Afterwards, the latest findings on ferroelectric HfO₂ are reviewed and their potential impact on future applications is discussed. Experimental data is presented afterwards focusing on the ferroelectric material characteristics of Si HfO₂ that are most relevant for memory applications. Besides others, the stability of the ferroelectric switching effect could be demonstrated in a temperature range of almost 400 K. Moreover, nanosecond switching speed and endurance in the range of 1 million to 10 billion cycles could be proven. Retention and imprint characteristics have furthermore been analyzed and are shown to be stable for 1000 hours bake time at 125 °C. Derived from the ferroelectric effect in HfO₂, a 28 nm FeFET memory cell is introduced as the central application of this thesis. Based on numerical simulations, the memory concept is explained and possible routes towards an optimized FeFET cell are discussed. Subsequently, the results from electrical characterization of FeFET multi-structures are presented and discussed. By using Si HfO₂, it was possible to realize the world's first 28 nm FeFET devices possessing a 10k cycling endurance and an extrapolated 10-year data retention at room temperature. The next step towards a FeFET memory is represented by connecting several memory cells into matrix-type configurations. A cell concept study illustrates the different ways in which FeFET cells can be combined together to give high-density memory arrays. For the proposed architectures, operational schemes are theoretically discussed and analyzed by both electrical characterization of FeFET multi-structures and numerical simulations. The thesis concludes with the electrical characterization of small FeFET memory arrays. First results show that a separation between memory states can be achieved by applying poling and incremental step-pulse programming (ISPP) sequences. These results represent an important cornerstone for future studies on Si HfO₂ and its related applications.
