

Breast Cancer History Research Paper

Breast cancer is a disease in which most commonly occurs in all women no matter their size, shape, race, or ethnicity. About one in eight women will be diagnosed with breast cancer every year, a fatal disease if not discovered early. Early detection of breast cancer is key so that cancerous cells found in the breast do not spread through other parts of the body. With an increasing prevalence in breast cancer today, the evolution of technology has been improved in order to both prevent and stop cancer in its entirety. Breast cancer, a major concern in the medical community today, motivates many to undergo screening every year and the new medical advances in 3D screening that evolve regularly; although no cure has been found for breast cancer, early detection and new and advanced technologies in both prevention and reconstruction can result in many lives being saved. Discoveries within the nineteenth and twentieth centuries, such as the first radical mastectomy performed by Stewart Halsted and the first mammograms performed by Albert Solomon, have rapidly progressed throughout time to continue to advance in the treatment and cure of breast cancer. Many other prevalent detections, new advancements, and innovations have been created throughout recent years to help aid a cure for breast cancer. Medical centers throughout the world are studying new ways to early detect, prevent, and cure breast cancer entirely. Although new technology has become available, the increase in prevalence of breast cancer has only expedited. "About 40,920 women in the U.S. are expected to die in 2018 from breast cancer, though death rates have been decreasing since 1989. Women under 50 have experienced larger decreases. These decreases are thought to be the result of treatment advances, earlier detection through screening, and increased awareness." Breast cancer can occur almost anywhere in the breast. This makes it even more important for women to conduct self-breast exams monthly and get mammograms yearly. Self-examinations allow women to feel for any abnormal bumps early, and mammography detects cancerous cells in the breast, and often early symptoms of breast cancer. Early detection of breast cancer is finding the cancerous cells before they spread to any other part of the breast. "Early detection means using an approach that allows earlier diagnosis of breast cancer than otherwise might have occurred. Most doctors feel that early detection tests for breast cancer save many thousands of lives each year, and that many more lives could be saved if even more women and their health care providers took advantage of these tests."³ Getting regular early screenings or mammograms are an important factor in lessening the risk of breast cancer. Unfortunately, for many breast cancer patients before the nineteenth century treatment options such as bloodletting and purging only led to more suffering and a slower death.⁴ Many women decide to not participate in yearly mammograms because of various reasons. Those reasons may include that the test is too expensive, women fear that doctors will find cancer in their breast, or they don't have medical insurance. This is why education and outreach about breast cancer are extremely imperative. The most common form of technology used to detect breast cancer would be a screen-filmed mammography. This machine takes X-Rays of the breast from center to side for women over the age of forty. After the mammogram is complete,
