

- (a) Since the possible values of settlement for Pier 1 overlap partially with those of Pier 2, it is possible that both Piers will have the same settlement. Hence, the minimum differential settlement is zero.

The maximum differential settlement will happen when the settlement of Pier 2 is 10 cm and that of Pier 1 is 2 cm, which yields a differential settlement of 8 cm.

Hence, the sample space of the differential settlement is zero to 8 cm.

- (b) If the differential settlement is assumed to be equally likely between 0 and 8 cm, the probability that it will be between 3 and 5 cm is equal to

$$P = \frac{5 - 3}{8 - 0} = \frac{2}{8} = 0.25$$

Ang, Wilson H. Tang, 2007 Apply the principles of probability and statistics to realistic engineering problems The easiest and most effective way to learn the principles of probabilistic modeling and statistical inference is to apply those principles to a variety of applications That's why Ang and Tang's Second Edition of Probability Concepts in Engineering previously titled Probability Concepts in Engineering Planning and Design explains concepts and methods using a wide range of problems related to engineering and the physical sciences particularly civil and environmental engineering Now extensively revised with new illustrative problems and new and expanded topics this Second Edition will help you develop a thorough understanding of probability and statistics and the ability to formulate and solve real world problems in engineering The authors present each basic principle using different examples and give you the opportunity to enhance your understanding with practice problems The text is ideally suited for

students as well as those wishing to learn and apply the principles and tools of statistics and probability through self study

Key Features in this 2nd Edition A new chapter Chapter 5 covers Computer Based Numerical and Simulation Methods in Probability to extend and expand the analytical methods to more complex engineering problems New and expanded coverage includes distribution of extreme values Chapter 3 the Anderson Darling method for goodness of fit test Chapter 6 hypothesis testing Chapter 6 the determination of confidence intervals in linear regression Chapter 8 and Bayesian regression and correlation analyses Chapter 9 Many new exercise problems in each chapter help you develop a working knowledge of concepts and methods Provides a wide variety of examples including many new to this edition to help you learn and understand specific concepts Illustrates the formulation and solution of engineering type probabilistic problems through computer based methods including developing computer codes using commercial software such as MATLAB and MATHCAD Introduces and develops analytical probabilistic models and shows how to formulate engineering problems under uncertainty and provides the fundamentals for quantitative risk assessment
