

MENDELIAN GENETICS PROBLEMS

Solve the problems using these five steps:

- a. Define characteristics and notation
- b. Identify parent's genotype
- c. Identify gametes from parents
- d. Punnett square
- e. Answer

These problems are divided into subdivisions composed of problems that require application of a specific genetic principle. These problems are intended to complement the lecture portion of this course; specifically, the material described in lecture is to be applied to solve these problems. The answers are provided in Appendix A. You are strongly advised against consulting this appendix before you have made a serious attempt to answer a problem.

A. Monohybrid Crosses

1. In *Coleus*, some plants have shallowly crenated edges and others have deeply incised leaves. A cross is made between homozygous deep and shallow individuals. The shallow trait is dominant.

a. Using *S* and *s* to symbolize the genes for this trait, give the phenotypic and genotypic ratios for the F₁ generation.

S is the shallow trait and *s* is the deep trait. The genotypic ratio is: 100% *Ss*. The phenotypic ratio is 100% dominant (shallow trait).

b. If self-pollination is allowed, what is the phenotypic ratio for the F₂ generation?

The phenotypic ratio is 75% dominant (shallow) and 25% recessive (deep).

2. a. In a pea plant that breeds true for tall, what possible gametes can be produced? Use the symbol *D* for tall, *d* for dwarf.

If the plant breeds true for tall then it must be *DD* and therefore all of the gametes it produces by self-fertilisation will also be *D*.

b. In a pea plant that breeds true for dwarf, what possible gametes will be produced?

If the plant breeds true for dwarf then it must be *dd* and therefore all of the gametes it produces by self-fertilisation will also be *d*.

c. What will be the genotype of F₁ offspring from a cross between these two types?

100% of the gametes of generation F₁ will have genotype *Dd*.
