Background

The Kidneys and Filtration

The **kidneys** are two organs, located in the lower back on either side of the spine. The kidneys are responsible for filtering substances, as well as maintaining a balance, or **homeostasis**, of substances in the blood. The **renal arteries** pass blood into the kidneys, and the **renal veins** bring blood back out of the kidneys. Anything that is removed from the blood by the kidneys ends up as **urine**. Urine flows from the kidney, down the **ureter**, and ends up in the **bladder**. From there urine can be released out of the **urethra**.

Within the kidneys a complex network of filtering units and tubes called the **nephrons** can be found. The part of the kidney that is responsible for filtering is the **glomerulus**. Small capillaries, called **glomerular capillaries**, lead into the glomerulus and allow the substances to pass through their thin membranes. The filtered substances are then passed through a complex network of tubes that eventually lead to the bladder. As these substances pass through this network and into the bladder, they may be reabsorbed or secreted from the body. The kidneys filter the entire volume of blood in our body 20-25 times every day (Freudenrich 2001).

Urinalysis

The urinalysis is a test that determines what is present in secreted urine. It can reveal many different types of diseases, even those without any visible symptoms. A urinalysis usually includes a visual observation of the urine for color and clarity, a microscopic observation for sediment particles, and a urine dipstick chemical analysis. The chemical analysis is capable of determining pH, specific gravity, glucose, proteins, bilirubin, ketones, presence of blood, urobilinogen nitrites, and leukocytes.

The urinalysis is a useful tool in determining whether a patient's kidneys are functioning regularly as well as helping to diagnose conditions including hydration level, infections, bacteria, liver disease, kidney stones, gallstones, anemia, kidney failure, proteinuria, diabetes, or drug use (just to name a few). Normal versus abnormal levels for a urinalysis, as well as possible conditions that may cause abnormal levels are included in the following data table:

Assessing Student Nurses and Midwives in Clinical Practice is a practical guide for healthcare practitioners responsible for the supervision and assessment of students. The book is designed to help practice supervisors and practice assessors to identify and plan for a range of learning opportunities to consider what is possible for learning and assessment in their area to get ready for and deliver the best learning experiences that they can to prepare students for their role as future nurses and midwives. Activities, top tips, examples and scenarios all help the reader to set the principles in context and to support students in achieving the NMC's standards of proficiency. Covering the learning environment and culture, interprofessional supervision, coaching models and feedback methods and types of assessment, simulation-based learning and the future of practice learning, the book aims to help individuals and organisations to create the best environment for supporting supervising and assessing students in practice. This is a contemporary text that is truly a practical guide that steers and supports. It is written in an accessible and user-friendly way helping the reader see through the complexities that are inherently associated with practice assessment. I sincerely recommend this book to students and practitioners who learn and practise together with the overall goal of offering high quality care that is safe and effective.
