**Correction Coding** William A. Geisel, 1990 **A Course in Error-correcting Codes** Jørn Justesen, Tom Høholdt, 2004 This book is written as a text for a course aimed at advanced undergraduates Chapters cover the codes and decoding methods that are currently of most interest in research development and application They give a relatively brief presentation of the essential results emphasizing the interrelations between different methods and proofs of all important results A sequence of problems at the end of each chapter serves to review the results and give the student an appreciation of the concepts

*Decoding of Reed Solomon Codes Beyond the Error-correction-bound* International Business Machines Corporation. Research Division, Madhu Sudan, 1996 *A Decoding Procedure for the Reed-Solomon Codes* Raymond S. Lim, 1978 A decoding procedure is described for the  $n \times k$  error correcting Reed Solomon RS code and an implementation of the 31 15 RS

code for the I4 TENEX central system This code can be used for error correction in large archival memory systems The principal features of the decoder are a Galois field arithmetic unit implemented by microprogramming a microprocessor and syndrome calculation by using the  $g(x)$  encoding shift register Complete decoding of the 31 15 code is expected to take less than 500 microsecs The syndrome calculation is performed by hardware using the encoding shift register and a modified Chien search The error location polynomial is computed by using Lin's table which is an interpretation of Berlekamp's iterative algorithm The error location numbers are calculated by using the Chien search Finally the error values are computed by using Forney's method

List Decoding of Error-Correcting Codes Venkatesan Guruswami, 2004-11-29 How can one exchange information effectively when the medium of communication introduces errors This question has been investigated extensively starting with the seminal works of Shannon 1948 and Hamming 1950 and has led to the rich theory of error correcting codes This theory has traditionally gone hand in hand with the algorithmic theory of decoding that tackles the problem of recovering from the errors efficiently This thesis presents some spectacular new results in the area of decoding algorithms for error correcting codes Specifically it shows how the notion of list decoding can be applied to recover from far more errors for a wide variety of error correcting codes than achievable before A brief bit of background error correcting codes are combinatorial structures that show how to represent or encode information so that it is resilient to a moderate number of errors Specifically an error correcting code takes a short binary string called the message and shows how to transform it into a longer binary string called the codeword so that if a small number of bits of the codeword are flipped the resulting string does not look like any other codeword The maximum number of errors that the code is guaranteed to detect denoted  $d$  is a central parameter in its design A basic property of such a code is that if the number of errors that occur is known to be smaller than  $d/2$  the message is determined uniquely This poses a computational problem called the decoding problem

compute the message from a corrupted codeword when the number of errors is less than  $d/2$

**A Decoding Procedure for the Reed-Solomon Codes** National Aeronautics and Space Administration, 2018-09-10 A decoding procedure is described for the  $n, k$  error correcting Reed Solomon RS code and an implementation of the 31 15 RS code for the I4 TENEX central system This code can be used for error correction in large archival memory systems The principal features of the decoder are a Galois field arithmetic unit implemented by microprogramming a microprocessor and syndrome calculation by using the  $g(x)$  encoding shift register Complete decoding of the 31 15 code is expected to take less than 500 microsecs The syndrome calculation is performed by hardware using the encoding shift register and a modified Chien search The error location polynomial is computed by using Lin's table which is an interpretation of Berlekamp's iterative algorithm The error location numbers are calculated by using the Chien search Finally the error values are computed by using Forney's method

**Algebraic Codes on Lines, Planes, and Curves** Richard E. Blahut, 2008-04-03 The past few years have witnessed significant developments in algebraic coding theory This

book provides an advanced treatment of the subject from an engineering perspective covering the basic principles and their application in communications and signal processing Emphasis is on codes defined on the line on the plane and on curves with the core ideas presented using commutative algebra and computational algebraic geometry made accessible using the Fourier transform Starting with codes defined on a line a background framework is established upon which the later chapters concerning codes on planes and on curves are developed The decoding algorithms are developed using the standard engineering approach applied to those of Reed Solomon codes enabling them to be evaluated against practical applications Integrating recent developments in the field into the classical treatment of algebraic coding this is an invaluable resource for graduate students and researchers in telecommunications and applied mathematics
