**A Philosophy for the Science of Animal Consciousness** Walter Veit, 2023-06-16 This book attempts to advance Donald Griffin's vision of the final crowning chapter of the Darwinian revolution by developing a philosophy for the science of animal consciousness It advocates a Darwinian bottom up approach that treats consciousness as a complex evolved and multidimensional phenomenon in nature rather than a mysterious all or

nothing property immune to the tools of science and restricted to a single species The so called emergence of a science of consciousness in the 1990s has at best been a science of human consciousness This book aims to advance a true Darwinian science of consciousness in which its evolutionary origin function and phylogenetic diversity are moved from the field s periphery to its very centre thus enabling us to integrate consciousness into an evolutionary view of life Accordingly this book has two objectives i to argue for the need and possibility of an evolutionary bottom up approach that addresses the problem of consciousness in terms of the evolutionary origins of a new ecological lifestyle that made consciousness worth having and ii to articulate a thesis and beginnings of a theory of the place of consciousness as a complex evolved phenomenon in nature that can help us to answer the question of what it is like to be a bat an octopus or a crow A Philosophy for the Science of Animal Consciousness will appeal to researchers and advanced students interested in advancing our understanding of animal minds as well as anyone with a keen interest in how we can develop a science of animal consciousness

**A Connectionist Machine for Genetic Hillclimbing** David Ackley, 2012-12-06 In the black box function optimization problem a search strategy is required to find an extremal point of a function without knowing the structure of the function or the range of possible function values Solving such problems efficiently requires two abilities On the one hand a strategy must be capable of learning while searching It must gather global information about the space and concentrate the search in the most promising regions On the other hand a strategy must be capable of sustained exploration If a search of the most promising region does not uncover a satisfactory point the strategy must redirect its efforts into other regions of the space This dissertation describes a connectionist learning machine that produces a search strategy called stochastic iterated genetic hillclimb ing SIGH Viewed over a short period of time SIGH displays a coarse to fine searching strategy like simulated annealing and genetic algorithms However in SIGH the convergence process is reversible The connectionist implementation makes it possible to diverge the search after it has converged and to recover coarse grained information about the space that was suppressed during convergence The

successful optimization of a complex function by SIGH usually involves a series of such converge-diverge cycles
