The behavior of structures composed of composite materials Jack R. Vinson, Robert L. Sierakowski, 2012-12-06 While currently available texts dealing with the subject of high performance composite materials touch upon a spectra of topics such as mechanical metallurgy physical metallurgy micromechanics and macro mechanics of such systems it is the specific purpose of this text to examine elements of the mechanics of structural components composed of composite materials This text is intended for use in training engineers in this new technology and rational thought processes necessary to develop a better understanding of the behavior of such material systems for use as structural components The concepts are further exploited in terms of the structural format and development to which the book is dedicated To this end the development progresses systematically by first introducing the notion and concepts of what these new material classes are the fabrication processes involved and their unique features relative to conventional monolithic materials Such introductory remarks while far too short in texts of this type appear necessary as a precursor for engineers to develop a better understanding for design purposes of both the threshold limits to which the properties of such systems can be pushed as well as the practical limitations on their manufacture Following these introductory remarks an in depth discussion of the important differences between composites and conventional monolithic material types is discussed in terms of developing the concepts associated with directional material properties

Includes sections on NCF, non crimp fabrics, natural fiber reinforcements, tufting, composite reinforcements, sustainability, multiscale modeling, knitted reinforcements and more. *Reinforcement for Modern Concrete Structures* Khan Mahmud Amanat, 2025-03-26 There are a lot of excellent textbooks on the design of reinforced concrete structures. However, based on professional experience of more than thirty years, the author feels that a separate book dedicated only to discuss the properties, behavior and use of reinforcement in concrete construction is highly justified. Conventional textbooks on concrete structures focus primarily on the mechanics of reinforced concrete design. Properties of reinforcement are discussed in a limited manner, only those which are deemed just adequate for discussing the theory of concrete mechanics. Typically, such books contain little or no background information or explanation as to why the various code provisions or rules regarding the reinforcement are imposed or formulated. It is observed that the application of modern materials and technologies in reinforcement manufacturing does not get proper attention or consideration in the engineering practices of many professionals. Based on the interaction with many engineers engaged in the design and construction of concrete structures, the author feels that there is a lack of the essential background knowledge of the engineering properties and behavior of concrete reinforcement among many of them. And such a lack of knowledge often leads to improper implementation of the code design provisions. Limited scope of our existing engineering curricula is primarily responsible for this. This book has been written with an aim to fill this gap and to make engineering students and practicing engineers more
