De Polavieja, German Sumbre, 2014-11-07 Understanding how the brain functions is one of the most ambitious current scientific goals This challenge will only be accomplished by a multidisciplinary approach involving genetics molecular biology optics ethology neurobiology and mathematics and using tractable model systems The zebrafish larva is a transparent genetically tractable small vertebrate ideal for the combination state of the art imaging techniques e g two photon scanning microscopy single plane illumination microscopy spatial light modulator microscopy and lightfield microscopy bioluminescence and optogenetics to monitor and manipulate neuronal activity from single specific neurons up to the entire brain in an intact behaving organism Furthermore the zebrafish model offers large and increasing collection of mutant and transgenic lines modelling human brain diseases With these advantages in hand the zebrafish larva became in the recent years a novel animal model to study neuronal circuits and behaviour taking us closer than ever before to understand how the brain controls behaviour **The Vascular Niche in Tissue Repair: A Therapeutic Target for Regeneration** Francisco J. Rivera, Ludwig Aigner, 2018-03-13 Tissues and organs have although sometimes limited the capacity for endogenous repair which is aimed to re establish integrity and homeostasis Tissue repair involves pro and anti inflammatory processes new

tissue formation and remodelling Depending on the local microenvironment tissue repair results either in scar tissue formation or in regeneration The latter aims to recapitulate the original tissue structure and architecture with the proper functionality Although some organisms such as planarians have a high regenerative capacity throughout the body in humans this property is more restricted to a few organs and tissues Regeneration in the adult is possible in particular through the existence of tissue resident pools of stem progenitor cells In response to tissue damage these cells are activated they proliferate and migrate and differentiate into mature cells Angiogenesis and neovascularization play a crucial role in tissue repair Besides providing with oxygen and nutrients angiogenesis generates a vascular niche VN consisting of different blood derived elements and endothelial cells surrounded by basement membrane as well as perivascular cells The newly generated VN communicates with the local stem progenitor cells and contributes to tissue repair For example platelets macrophages neutrophils perivascular cells and other VN components actively participate in the repair of skin bone muscle tendon brain spinal cord etc Despite these observations the exact role of the VN in tissue repair and the underlying mechanisms are still unclear and are awaiting further evidence that indeed will be required for the development of regenerative therapies for the treatment of traumatic injuries as well as degenerative diseases [Selected Water Resources Abstracts](#) ,1987 *Spinal Evolution* Ella Been,Asier Gómez-Olivencia,Patricia Ann Kramer,2019-08-07 The vertebral spine is a key element of the human anatomy Its main role is to protect the spinal cord and the main blood vessels The axial skeleton with its muscles and joints provides stability for the attachment of the head tail and limbs and at the same time enables the mobility required for breathing and for locomotion Despite its great importance the vertebral spine is often over looked by researchers because a vertebrae are fragile in nature which makes their fossilization a rare event b they are metameric seriated and repeated elements that make their anatomical determination and thus their subsequent study difficult and c the plethora of bones and joints involved in every movement or function of the axial skeleton makes the reconstruction of posture breathing mechanics and locomotion extremely difficult It is well established that the spine has changed dramatically during human evolution Spinal curvatures spinal load transmission and thoracic shape of bipedal humans are derived among hominoids Yet there are many debates as to how and when these changes occurred and to their phylogenetic functional and pathological implications In recent years renewed interest arose in the axial skeleton New and exciting finds mostly from Europe and Africa as well as new methods for reconstructing the spine have been introduced to the research community New methodologies such as Finite Element Analysis trabecular bone analysis Geometric Morphometric analysis and gait analysis have been applied to the spines of primates and humans These provide a new and refreshing look into the evolution of the spine Advanced biomechanical research regarding posture range of motion stability and attenuation of the human spine has interesting evolutionary implications Until now no book that summarizes the updated research and knowledge regarding spinal evolution in hominoids has been available The present book explores both these new methodologies and new data including recent

fossil morphological biomechanical and theoretical advances regarding vertebral column evolution In order to cover all of that data we divide the book into four parts 1 the spine of hominoids 2 the vertebral spine of extinct hominins 3 ontogeny biomechanics and pathology of the human spine and 4 new methodologies of spinal research These parts complement each other and provide a wide and comprehensive examination of spinal evolution **Wildlife Research** ,2014 *Managing Deep-sea Ecosystems at Ocean Basin Scale, Volume 1* J. Murray Roberts,Telmo Morato,2022-04-01 **American and Australasian Marsupials** Nilton C. Cáceres,Christopher R. Dickman,2023-06-30 This book focuses on the evolution biogeography systematics taxonomy and ecology of New World and Australasian marsupials greatly expanding the current knowledge base There are roughly 140 species of New World marsupials of which the opossum is the best known Thanks to recent research there is now an increasing amount of understanding about their evolution biogeography systematics ecology and conservation in the Americas especially in South America There are also some 270 marsupial species in the Australasian region many of which have been subject to research only in recent years Based on this information and the authors extensive research this book provides comprehensive insights into the world s marsupials It will appeal to academics and specialized researchers students of zoology paleontology evolutionary biology ecology physiology and conservation as well as interested non experts Extinction Learning from a Mechanistic and Systems Perspective Denise Manahan-Vaughan,Onur Gunturkun,Oliver T. Wolf,2016-08-08 Throughout their lifetime animals learn to associate stimuli with their consequences Following memory acquisition and consolidation circumstances may arise that necessitate that initially learned behaviour is no longer relevant The ensuing process is called extinction learning and involves a novel and complex learning procedure that involves a large number of neural entities While the neural fundamentals of the initial acquisition are well studied our understanding of the behavioural and neural basis of extinction is still limited and derives mostly from rodent data acquired through fear conditioning paradigms Fear conditioning and extinction in rodents is a spectacularly successful paradigm within behavioral neuroscience However in recent years new approaches have been emerging that examine the mechanisms of extinction learning in different setting that also involve appetitive models a broader comparative perspective a focus on other brain systems an examination of hormonal factors and conditioning of immune responses Only a broader analysis of the neural fundamentals of extinction learning will finally uncover shared and distinct mechanisms that underlie extinction learning in different functional systems The papers compiled in this Research Topic offer new and valuable insights into the mechanisms and functional implementation of extinction learning at its different levels of complexity and form the basis for new concepts and research ideas in this field Culture History and Convergent Evolution Huw S. Groucutt,2020-07-23 This volume brings together diverse contributions from leading archaeologists and paleoanthropologists covering various spatial and temporal periods to distinguish convergent evolution from cultural transmission in order to see if we can discover ancient human populations With a focus on lithic technology the book analyzes ancient materials and cultures to

systematically explore the theoretical and physical aspects of culture convergence and populations in human evolution and prehistory The book will be of interest to academics students and researchers in archaeology paleoanthropology genetics and paleontology The book begins by addressing early prehistory discussing the convergent evolution of behaviors and the diverse ecological conditions driving the success of different evolutionary paths Chapters discuss these topics and technology in the context of the Lower Paleolithic Earlier Stone age and Middle Paleolithic Middle Stone Age The book then moves towards a focus on the prehistory of our species over the last 40 000 years Topics covered include the human evolutionary and dispersal consequences of the Middle Upper Paleolithic Transition in Western Eurasia Readers will also learn about the cultural convergences and divergences that occurred during the Terminal Pleistocene and Holocene such as the budding of human societies in the Americas The book concludes by integrating these various perspectives and theories and explores different methods of analysis to link technological developments and cultural convergence

Fish Sense (Picador Shorts) Jonathan Balcombe, 2025-06-10 A quirky intimate and eye opening look into the ways of thinking like a fish An extract from the much loved modern classic on the subject of fish consciousness What a Fish Knows Do fishes think Do they really have three second memories And can they recognize the humans who peer back at them from above the surface of the water Jonathan Balcombe dives in among our marine cousins to explore the essential questions of how fish perceive and process the world With his ethologist's gift for showing us the hidden depths of questions we've routinely preferred to think of as simple and his raconteur's flair for the surprising and the curious Balcombe takes us under the sea through streams and estuaries and to the other side of the aquarium glass to reveal the surprising capabilities of fishes Balcombe upends our assumptions about fishes portraying them not as unfeeling dead eyed feeding machines but as sentient aware social and even Machiavellian in other words much like us Using humor and a repertoire of some of the most surprising fish facts you've ever heard Balcombe shakes up what you think you know about what's going on inside the mind of these denizens of the deep Fish Sense is part of the Picador Shorts series Oceans Rivers and Streams in which excerpts from beloved classics speak to our relationship with our water bodies great and small
