Marco Scortichini,Dawn Arnold,Olivier Pruvost,Marie-Agnès Jacques ,Adriana J. Bernal,2024-04-29 The strict relationships between bacteria and plants represents one of the major facets of terrestrial ecology Depending on the type of interaction and amount of metabolic advantage one organism can obtain from such relationships these are classified as mutualistic commensal or parasitic interactions Within this context Pseudomonas and Xanthomonas are bacterial genera with a worldwide spread capable of establishing all of the above mentioned interactions with plants Therefore they represent good models for studying different lifestyles and accordingly deciphering distinct evolutionary trajectories followed by different lineages of a single genus to infect and or to establish a mutualistic relationships with the plant Some members of these two genera are regulated pests that are recognized as economically major threats for their host crop s both in temperate and tropical environments

**Grappling with the Multifaceted World of the DNA Damage Response** Antonio Porro, 2017-01-10 DNA damage is a major threat to genomic integrity and cell survival It can arise both spontaneously and in response to exogenous agents DNA damage can attack most parts of the DNA structure ranging from minor and major chemical modifications to single strand breaks SSBs and gaps to full double strand breaks DSBs If DNA injuries are mis repaired or unrepaired they may ultimately result in mutations or wider scale genome aberrations that threaten cell homeostasis Consequently the cells elicit an elaborate signalling network known as DNA damage response DDR to detect and repair these cytotoxic lesions This Research Topic was aimed at comprehensive investigations of basic and novel mechanisms that underlie the DNA damage response in eukaryotes

**Stress and Environmental Regulation of Gene Expression and Adaptation in Bacteria, 2 Volume Set** Frans J. de Bruijn, 2016-09-06 Bacteria in various habitats are subject to continuously changing environmental conditions such as nutrient deprivation heat and cold stress UV radiation oxidative stress dessication acid stress nitrosative stress cell envelope stress heavy metal exposure osmotic stress and others In order to survive they have to respond to these conditions by adapting their physiology through sometimes drastic changes in gene expression In addition they may adapt by changing their morphology forming biofilms fruiting bodies or spores filaments Viable But Not Culturable VBNC cells or moving away from stress compounds via chemotaxis Changes in gene expression constitute the main component of the bacterial response to stress and environmental changes and involve a myriad of different mechanisms including alternative sigma factors bi or tri component regulatory systems small non coding RNA s chaperones CHRIS Cas systems DNA repair toxin antitoxin systems the stringent response efflux pumps alarmones and modulation of the cell envelope or membranes to name a few Many regulatory elements are conserved in different bacteria however there are endless variations on the theme and novel elements of gene regulation in bacteria inhabiting particular environments are constantly being discovered Especially in pathogenic bacteria colonizing the human body a plethora of bacterial responses to innate stresses such as pH reactive nitrogen and oxygen species and antibiotic stress are being described An attempt is made to not only cover model systems but give a broad overview of the stress responsive regulatory systems in a variety of bacteria including medically important bacteria where elucidation of certain aspects of these systems could lead to treatment strategies of the pathogens Many of the regulatory systems being uncovered are specific but there is also considerable cross talk between different circuits Stress and Environmental Regulation of Gene Expression and Adaptation in Bacteria is a comprehensive two volume work bringing together both review and original research articles on key topics in stress and environmental control of gene expression in bacteria Volume One contains key overview chapters as well as content on one two three component regulatory systems and stress responses sigma factors and stress responses small non coding RNAs and stress responses toxin antitoxin systems and stress responses stringent response to stress responses to UV irradiation SOS and double stranded systems repair systems and stress adaptation to both oxidative and osmotic stress and desiccation tolerance and drought stress Volume Two covers heat shock responses chaperonins and stress cold shock responses adaptation to acid stress nitrosative stress and envelope stress as well as iron homeostasis metal resistance quorum sensing chemotaxis and biofilm formation and viable but not culturable VBNC cells Covering the full breadth of current stress and environmental control of gene expression studies and expanding it towards future advances in the field these two volumes are a one stop reference for non medical molecular geneticists interested in gene regulation under stress
