rubber mount because their frequency and amplitude response is superior Fluid analysis is more complex so linear models and theory on two degree of freedom is developed in this thesis Presently companies are more concern about customer satisfaction in automobile industries Passenger may get more comfort if vibration induced due to uneven road or engine is reduced Selection of proper engine mount location and optimization of mounts parameter as per application is required Force transmitted to passengers needs to be reduced In this thesis I applied knowledge from my curricular courses like vibration technology and computer aided design of dynamic system which helped me to build bond and block diagram of whole powertrain system I used software CAMPG Matlab Mathematica and Nastran to optimize parameter Hydraulic engine mounts can be made more effective by varying the inertia area and stiffness parameter They can operate on wide frequency range by varying stiffness using inertia area Transmissibility is reduced which enables more comfortable ride
