Chapter 10: Crustal Deformation and Mountain Building Concepts Check

- 1) What is rock deformation? How might a rock body change during deformation?

Deformation is a rock's reaction to stress, which can cause a rock to change its shape or position; most crustal deformation occurs along plate boundaries.

- 2) How is brittle deformation different from ductile deformation?

Brittle Deformation = rock breaks while undergoing elastic strain. Ductile Deformation = rock breaks while undergoing plastic strain.

- 3) List and describe the four factors that affect rock strength.

temperature, confining pressure, fluid pressure, and the length of time the stress is applied.

- 4) Describe Anticlines and Synclines

Anticlines-An anticline is a fold that is convex upward

Synclines- a syncline is a fold that is concave upward

- 4) What types of faults are associated with fault-block mountains?

Normal faults.

- 5) Define Orogenesis

the formation of mountain ranges by intense upward displacement of the earth's crust, usually associated with folding, thrust faulting, and other compressional processes.

- 6) What is Isostasy?

the rising or settling of a portion of the Earth's lithosphere occurs when weight is removed or added to maintain equilibrium between buoyancy forces that push the lithosphere upward and gravity forces that pull the lithosphere downward.

- 7) What is a passive continental margin? Give an example.

A passive continental margin occurs where the transition from land to sea is not associated with a plate boundary. The east coast of the United States is a good example; the plate boundary is located along the mid-Atlantic ridge, far from the coast.

- 9) What is an Active continental margin? Give an example.

**Earth, Our Living Planet** Philippe Bertrand,Louis Legendre,2021-04-21 Earth is to our knowledge the only life bearing body in the Solar System This extraordinary characteristic dates back almost 4 billion years How to explain that Earth is teeming with organisms and that this has lasted for so long What makes Earth different from its sister planets Mars and Venus The habitability of a planet is its capacity to allow the emergence of organisms What astronomical and geological conditions concurred to make Earth habitable 4 billion years ago and how has it remained habitable since What have been the respective roles of non biological and biological characteristics in maintaining the habitability of Earth This unique book answers the above questions by considering the roles of organisms and ecosystems in the Earth System which is made of the non living and living components of the planet Organisms have progressively occupied all the habitats of the planet diversifying into countless life forms and developing enormous biomasses over the past 3 6 billion years In this way organisms and ecosystems took over the Earth System and

thus became major agents in its regulation and global evolution There was co evolution of the different components of the Earth System leading to a number of feedback mechanisms that regulated long term Earth conditions For millennia and especially since the Industrial Revolution nearly 300 years ago humans have gradually transformed the Earth System Technological developments combined with the large increase in human population have led in recent decades to major changes in the Earth s climate soils biodiversity and quality of air and water After some successes in the 20th century at preventing internationally environmental disasters human societies are now facing major challenges arising from climate change Some of these challenges are short term and others concern the thousand year evolution of the Earth s climate Humans should become the stewards of Earth
