

Prelab Information

Purpose	Explore the molecular process of building proteins from the information carried by RNA using a laboratory procedure.
Time	Approximately 45 minutes
Question	How are proteins built using the information provided by a molecule of RNA?
Prediction	RNA determines the sequence of amino acids in proteins and polypeptides by a two-step process: transcription of DNA produces mRNA in the nucleus, then translation of the mRNA to tRNA takes place at the ribosome in the cytoplasm.

Lab Procedure

Materials:

- helicase
- human cell
- tRNA sequence
- protein structure chart

Step 1: Transcribe the Information in DNA to mRNA

(The animation will zoom from the human cell to the nucleus to the DNA strand.)

- Find and click the arrow that represents the direction in which the mRNA is built. Like DNA, mRNA is always built from the 5' direction to the 3'.
- Which RNA nucleotide can pair with the thymine (T) at the beginning of the strand? Drag it into the DNA antisense strand to make a pair.
- Complete nine (9) additional base pairs. Remember, there is no thymine (T) in RNA. The adenine (A) in the DNA needs to pair with uracil (U).
- After your mRNA sequence record is complete, click "Leave the Nucleus" to send the mRNA to the ribosome in the cell's cytoplasm, where production of proteins will take place.

Step 2: Locate Codons

(You will continue to read mRNA from the 5' end toward the 3' end.)

- A codon is a sequence of three bases that indicates a unit of information in the RNA. A gene is a series of codons that results in the production of a protein. Identify the codons of the mRNA shown. The start codon for a gene is AUG, so start by dragging the blue start codon box over the AUG on the strand. (The start codon is already recorded on the data table.)
- Use the gray codon box to highlight additional codons three bases at a time. When you reach a stop codon (either UAA, UAG, or UGA) you will need to use the pink stop codon box. As you form codons, record them in Table 1.

Step 3: Translate mRNA

tRNA is composed of short sections of RNA that bond to the codons in mRNA. The screen shows a pool of tRNA anticodons, which carry the amino acids to the ribosome and attach to the mRNA when its sequence of base pairs is complementary with the mRNA in the ribosome.

- For each codon, you will find the correct tRNA anticodon and drag it to the ribosome. Start with the AUG codon in the ribosome. Find and drag its match, the UAC anticodon, to it. Record this

Clinical and Laboratory Medicine Textbook Marcello Ciaccio,2024-02-21 This textbook describes several diseases and clinical conditions from physiopathological mechanisms to main clinical pictures highlighting the importance of laboratory medicine with the aim to provide the necessary tools for guiding correct laboratory findings interpretation. Indeed it is now widely recognized that laboratory medicine has a pivotal role in clinical medicine significantly influencing clinical decisions. Thus it is crucial to understand and use laboratory data appropriately. This book has the great advantage of describing each topic exhaustively in order to facilitate its understanding. Specifically it describes both diseases with a high incidence in the population such as Diabetes Mellitus, Cardiovascular Diseases, Dyslipidemias and Autoimmune Diseases as well as rare diseases such as Hereditary Metabolic Diseases. In addition unusual topics are treated such as Clinical Biochemistry of the Mind as well as hot topics such as Biological Drugs, Biobanks, Health Technology Assessment and Omics Sciences. Finally the book includes a chapter on the new health emergency the SARS-CoV-2 pandemic. Two appendices are provided at the end of the book: a table summarizing the reference range and decisional cut-off for the main laboratory parameters and instructions on performing a venous blood sample. The book will be an invaluable tool for medical and biomedical students as well as for practitioners.

Prospects and Applications for Plant-Associated Microbes, A laboratory manual Seppo Sorvari,Anna Maria Pirttilä,2014-12-15 Research on the microbial colonization of the aerial and subterranean tissues of plants has shown an extensive scale of interactions between the hosts and a range of microbes including bacteria and fungi. Intercellular spaces, vascular systems and even single cells can be inhabited by these endophytic microbes. Of the bacterial endophytes only a small percentage is harmful to the plant; most are neutral, opportunistic or beneficial. These plant-based bacteria can have various important functions throughout the life cycle of the plant: some promote plant growth and development, others protect the plant from diseases. This ability to be able to protect plants from diseases has catalyzed numerous laboratories to search for new bacteria that could be utilized instead of the traditional plant protective agents. Because two or more interacting organisms are involved, research and the eventual application of suitable biocontrolling microbes are challenging and often require specific skills and equipment. The purpose of this book is to provide a
