and the Southern Ocean and global marine ecosystems If melted the Antarctic Ice Sheet would be a major contributor to global sea level rise In winter the surface of the ocean around Antarctica freezes and sea ice forms At the height of winter the area of sea ice that forms is as large as Antarctica itself but it melts back to the continent every summer The amount of sea ice that forms in winter and melts back each summer is different We examine this annual fluctuation of sea ice area around Antarctica for indications of climate change Sea ice provides important habitats for primary producers such as sea ice algae and Antarctic krill a keystone species of the Southern Ocean ecosystem Sea ice is also an important habitat for penguins and seals This collection aims to inform young readers about fundamental knowledge and digested cutting edge science that will help increase their understanding of Antarctica and its central role as a global climate driver In addition to the Editors hosting we would acknowledge the coordination and organization efforts of Pat Wongpan
