Kirschvink, Douglas S. Jones, Bruce J. MacFadden, 2013-04-17 The mystery of how migrating animals find their way over unfamiliar terrain has intrigued people for centuries and has been the focus of productive research in the biological sciences for several decades Whether or not the earth's magnetic field had anything to do with their navigational abilities has surfaced and been dismissed several times beginning at least in the mid to late 1800s This topic generally remained out of the mainstream of scientific research for two reasons 1 The apparent irreproducibility of many of the behavioral experiments which were supposed to demonstrate the existence of the magnetic sense and 2 Perceived theoretical difficulties which were encountered when biophysicists tried to understand how such a sensory system might operate However during the mid to late 1960s as the science of ethology animal behavior grew it became clear from studies on bees and birds that the geomagnetic field is used under a variety of conditions As more and more organisms were found to have similar abilities the problem shifted back to the question as to the basis of this perception Of the various schemes for transducing the geomagnetic field to the nervous system which have been proposed the hypothesis of magnetite based magnetoreception discussed at length in this volume has perhaps the best potential for explaining a wide range of these effects even though this link is as yet clear only in the case of magnetotactic bacteria *Nonlinear Structures and Systems, Volume 1* Gaetan Kerschen, M.
