Instructions: Read the following passage about the troposphere and then answer the questions on the information.

The troposphere is the lowest layer of Earth's atmosphere and is located between the Earth's surface and the stratosphere. It extends from the ground up to an average height of 7 to 20 kilometers, with the exact height varying based on location and time of day. The troposphere is primarily composed of nitrogen and oxygen, which make up about 99% of its volume, with trace amounts of other gases such as argon, carbon dioxide, neon, helium, and methane. It also contains water vapor, which varies in concentration depending on temperature and humidity levels. The temperature of the troposphere decreases as altitude increases, with an average decrease of 6.5 degrees Celsius per kilometer.

One of the most important functions of the troposphere is its role in regulating the Earth's climate. The temperature and humidity of the troposphere affect the Earth's energy balance, and changes to these variables can result in significant shifts in global climate patterns. The troposphere is also responsible for the Earth's water cycle, which involves the evaporation of water from the Earth's surface, the formation of clouds, and
