Excursions in Number Theory, Algebra, and Analysis Kenneth Ireland, Al Cuoco, 2023-03-27 This textbook originates from a course taught by the late Ken Ireland in 1972 Designed to explore the theoretical underpinnings of undergraduate mathematics the course focused on interrelationships and hands on experience Readers of this textbook will be taken on a modern rendering of Ireland's path of discovery consisting of excursions into number theory algebra and analysis Replete with surprising connections deep insights and brilliantly curated invitations to try problems at just the right moment this journey weaves a rich body of knowledge that is ideal for those going on to study or teach mathematics A pool of 200 Dialing In problems opens the book providing fuel for active enquiry throughout a course The following chapters develop theory to illuminate the observations and roadblocks encountered in the problems situating them in the broader mathematical landscape Topics cover polygons and modular arithmetic the fundamental theorems of arithmetic and algebra irrational algebraic and transcendental numbers and Fourier series and Gauss sums A lively accompaniment of examples exercises historical anecdotes and asides adds motivation and context to the theory Return trips to the Dialing In problems are encouraged offering opportunities to put theory into practice and make lasting connections along the way Excursions in Number Theory Algebra and Analysis invites readers on a journey as important as the destination Suitable for a senior capstone professional development for practicing teachers or independent reading this textbook offers insights and skills valuable to math majors and high school teachers alike A background in real analysis and abstract algebra is assumed though the most important prerequisite is a willingness to put pen to paper and do some mathematics Conics Keith Kendig, 2020-07-29 This book engages the reader in a journey of discovery through a spirited discussion among three characters philosopher teacher and student Throughout the book philosopher pursues his dream of a unified theory of conics where exceptions are banished With a helpful teacher and example hungry student the trio soon finds that conics reveal much of their beauty when viewed over the complex numbers It is profusely illustrated with pictures worked out examples and a CD containing 36 applets Conics is written in an easy conversational style and many historical tidbits and other points of interest are scattered throughout the text Many students can self study the book without outside help This book is ideal for anyone having a little exposure to linear algebra and complex numbers **Punchline Algebra** Steve Marcy, Janis Marcy, 2006 **Linear Algebra and Geometry** Al Cuoco, Kevin Waterman, Bowen Kerins, Elena Kaczorowski, Michelle Manes, 2019-04-10 Linear Algebra and Geometry is organized around carefully sequenced problems that help students build both the tools and the habits that provide a solid basis for further study in mathematics Requiring only high school algebra it uses elementary geometry to build the beautiful edifice of results and methods that make linear algebra such an important field The materials in Linear Algebra and Geometry have been used field tested and refined for over two decades It is aimed at preservice and practicing high school mathematics teachers and advanced high school students looking for an addition to

or replacement for calculus Secondary teachers will find the emphasis on developing effective habits of mind especially helpful The book is written in a friendly approachable voice and contains nearly a thousand problems An instructor s manual for this title is available electronically to those instructors who have adopted the textbook for classroom use Please send email to textbooks\_ams\_org for more information

*Beliefs and Attitudes in Mathematics Education* Jürgen Maasz,Wolfgang Schölglmann,2019-02-11 During the last fifteen years research on affect has been of considerable interest to the mathematics education community Researchers with an interest in mathematics and gender had a look at aspects of affect in their research studies right from the beginning Similarly many studies of mathematical problem solving had a growing interest in affect The main focus of research are now student beliefs and teacher beliefs which are identified as important factors for those influencing learning and teaching The thirteen chapters of this book involve many aspect of research on affect like theoretical problems of defining beliefs the complex relationship between content knowledge and affect espoused beliefs and teaching practice domain specific beliefs as well as the relationship between special learning conditions and affective reactions

**Applications of Algebra and Geometry to the Work of Teaching** Bowen Kerins,Benjamin Sinwell, Darryl Yong,Al Cuoco,Glenn Stevens,2015-10-05 Designed for precollege teachers by a collaborative of teachers educators and mathematicians Applications of Algebra and Geometry to the Work of Teaching is based on a course offered in the Summer School Teacher Program at the Park City Mathematics Institute But this book isn t a course in the traditional sense It consists of a carefully sequenced collection of problem sets designed to develop several interconnected mathematical themes and one of the goals of the problem sets is for readers to uncover these themes for themselves The specific theme developed in Applications of Algebra and Geometry to the Work of Teaching is the use of complex numbers especially the arithmetic of Gaussian and Eisenstein integers to investigate some questions that are at the intersection of algebra and geometry like the classification of Pythagorean triples and the number of representations of an integer as the sum of two squares Applications of Algebra and Geometry to the Work of Teaching is a volume of the book series IAS PCMI The Teacher Program Series published by the American Mathematical Society Each volume in that series covers the content of one Summer School Teacher Program year and is independent of the rest Titles in this series are co published with the Institute for Advanced Study Park City Mathematics Institute Members of the Mathematical Association of America MAA and the National Council of Teachers of Mathematics NCTM receive a 20% discount from list price

Abstract Algebra Joseph H. Silverman, 2022-03-07 This abstract algebra textbook takes an integrated approach that highlights the similarities of fundamental algebraic structures among a number of topics The book begins by introducing groups rings vector spaces and fields emphasizing examples definitions homomorphisms and proofs The goal is to explain how all of the constructions fit into an axiomatic framework and to emphasize the importance of studying those maps that preserve the underlying algebraic structure This fast paced introduction is followed by chapters in which each of the four main topics is revisited and deeper results are proven The second half of the book contains material of a more advanced nature It includes a thorough development of Galois theory a chapter on modules and short surveys of additional algebraic topics designed to whet the reader's appetite for further study This book is intended for a first introduction to abstract algebra and requires only a course in linear algebra as a prerequisite The more advanced material could be used in an introductory graduate level course

Greenes, 2008 Examines the status of algebra in our schools and the changes that the curriculum has undergone over the past several years Includes successful classroom practises for developing algebraic reasoning abilities and improving overall understanding

**The Role of Nonassociative Algebra in Projective Geometry** John R. Faulkner, 2014-10-09 There is a particular fascination when two apparently disjoint areas of mathematics turn out to have a meaningful connection to each other The main goal of this book is to provide a largely self contained in depth account of the linkage between nonassociative algebra and projective planes with particular emphasis on octonion planes There are several new results and many if not most of the proofs are new The development should be accessible to most graduate students and should give them introductions to two areas which are often referenced but not often taught On the geometric side the book introduces coordinates in projective planes and relates coordinate properties to transitivity properties of certain automorphisms and to configuration conditions It also classifies higher dimensional geometries and determines their automorphisms The exceptional octonion plane is studied in detail in a geometric context that allows nondivision coordinates An axiomatic version of that context is also provided Finally some connections of nonassociative algebra to other geometries including buildings are outlined On the algebraic side basic properties of alternative algebras are derived including the classification of alternative division rings As tools for the study of the geometries an axiomatic development of dimension the basics of quadratic forms a treatment of homogeneous maps and their polarizations and a study of norm forms on hermitian matrices over composition algebras are included

*More Concise Algebraic Topology* J. P. May, K. Ponto, 2012-02 With firm foundations dating only from the 1950s algebraic topology is a relatively young area of mathematics There are very few textbooks that treat fundamental topics beyond a first course and many topics now essential to the field are not treated in any textbook J Peter May's *A Concise Course in Algebraic Topology* addresses the standard first course material such as fundamental groups covering spaces the basics of homotopy theory and homology and cohomology In this sequel May and his coauthor Kathleen Ponto cover topics that are essential for algebraic topologists and others interested in algebraic topology but that are not treated in standard texts They focus on the localization and completion of topological spaces model categories and Hopf algebras The first half of the book sets out the basic theory of localization and completion of nilpotent spaces using the most elementary treatment the authors know of It makes no use of simplicial techniques or model categories and it provides full details of other necessary preliminaries With these topics as motivation most of the second half of the book sets out the theory of model categories which is the central organizing framework for homotopical algebra in general Examples from topology and homological algebra are treated in parallel A short last part develops the basic theory of bialgebras and Hopf algebras
