1. You have sampled a population in which you know that the percentage of the homozygous recessive genotype (aa) is 16%. Doing that, let's just assume that the population is under Hardy-Weinberg conditions, in the following:

- a. The frequency of the "a" genotype.

Since the homozygous recessive is 16% (given as the frequency of aa), $q^2 = 0.16$.

- b. The frequency of the "a" allele.

Since we can assume Hardy-Weinberg, the frequency of the "a" allele, as given by the frequency p^2 ($p^2 + q^2 = 1$), is the square root of 0.16 = 0.4. ($q^2 = 0.16$, so $q =$ square root of 0.16 = 0.4)

- c. The frequency of the "A" allele.

Using the formula $p + q = 1$, and knowing that $q = 0.4$ from above, $p = 0.6$. ($p = 1 - 0.4 = 0.6$)

- d. The frequency of the genotypes "AA" and "Aa."

Using the Hardy-Weinberg, $AA = p^2 = (0.6)^2 = 0.36$, $Aa = 2pq = 2(0.6)(0.4) = 0.48$. Remember that, to check your work, the frequencies of AA , Aa , and aa have to add up to 1. If not, you made a math error. (Just's see: $0.36 + 0.48 + 0.16 = 1$. FINE!)

- e. The frequencies of the two possible phenotypes if "A" is completely dominant over "a."

The phenotypes are "dominant" and "recessive." We know that "recessive" comes from genotype aa , which has frequency 0.16. "Dominant" must be the two genotypes AA and Aa , so $1 - 0.16 = 0.84$. You could also add the frequencies of AA to the frequency of Aa = $0.36 + 0.48 = 0.84$.

Equilibrium Thomas R. Blackburn, 1969

Chemical Equilibrium William Guenther, 1975-12 The present work is designed to provide a practical introduction to aqueous equilibrium phenomena for both students and research workers in chemistry biochemistry geochemistry and interdisciplinary environmental fields The pedagogical strategy I have adopted makes heavy use of detailed examples of problem solving from real cases arising both in laboratory research and in the study of systems occurring in nature The procedure starts with mathematically complete equations that will provide valid solutions of equilibrium problems instead of

the traditional approach through approximate concentrations and idealized infinite dilution assumptions There is repeated emphasis on the use of corrected conditional equilibrium constants and on the checking of numerical results by substitution in complete equations and or against graphs of species distributions Graphical methods of calculation and display are used extensively because of their value in clarifying equilibria and in leading one quickly to valid numerical approximations The coverage of solution equilibrium phenomena is not however exhaustively comprehensive Rather I have chosen to offer fundamental and rigorous examinations of homogeneous step equilibria and their interactions with solubility and redox equilibria Many examples are worked out in detail to demonstrate the use of equilibrium calculations and diagrams in various fields of investigation
