### **Exam 2023**

How many different types of molecules are shown in Model 1? - ANSWER two: circle and triangle

Number of triangles and circles on each side of membrane? - ANSWER 14 triangles on left: 0 triangles on right

12 circles on left: 13 circles on right

Which shape is larger? - ANSWER triangle

Describe direction of movement of molecules in Model 1. - ANSWER Random-all directions

Which molecules are able to pass through the semi-permeable membrane? - ANSWER Circles can fit through the gaps due to small size and are nearly equally distributed on both sides of the membrane.

Would you expect the Model 1 system to change over time? - ANSWER No. The triangles will remain on the left side because they are too big to pass through membrane. Circles will remain evenly distributed on both sides due to size and random movement.

What two major types of biological molecules compose the majority of the cell membrane in Model 2? - ANSWER Phospholipids and membrane spanning proteins.

How many different protein molecules are found in Model 2? - ANSWER Four. Two small surface proteins and 2 membrane spanning proteins.

What is the difference between the position of the surface proteins and the membrane-spanning proteins? - ANSWER Surface proteins do not span the cell membrane.

When a carbohydrate chain is attached to a protein, what is the structure called? - ANSWER Glycoprotein; glyco = carbohydrate

When a carbohydrate is attached to a phospholipid, what is the structure called? - ANSWER Glycolipid

Membrane Structure and Its Biological Applications David Ezra Green, New York Academy of Sciences, 1972

Membrane structure, 1972      *Membrane Dynamics and Domains* Peter J. Quinn, 2004-07-02 The fluid mosaic model of membrane structure formulated by Singer and Nicolson in the early 1970s has proven to be a durable concept in terms of the principles governing the organization of the constituent lipids and proteins During the past 30 or so years a great deal of information has accumulated on the composition of various cell membranes and how this is related to the different functions that membranes perform Nevertheless the task of explaining particular functions at the molecular level has been hampered by lack of structural detail at the atomic level The reason for this is primarily the difficulty of crystallizing membrane proteins which require strategies that differ from those used to crystallize soluble proteins The unique exception is bacteriorhodopsin of the purple membrane of *Halobacterium halobium* which is interpolated into a membrane that is neither fluid nor in a mosaic configuration To date only 50 or so membrane proteins have been characterised to atomic resolution by diffraction methods in contrast to the vast data accumulated on soluble proteins Another factor that has been difficult to explain is the reason why the lipid complement of membranes is often extremely complex Many hundreds of different molecular species of lipid can be identified in some membranes Remarkably the particular composition of each membrane appears to be maintained within relatively narrow limits and its identity distinguished from other morphologically distinct membranes      *Biophysical Approaches for the Study of Membrane Structure Part A*, 2024-07-05 Biophysical Approaches for the Study of Membrane Structure Part A Volume 700 explores lipid membrane asymmetry and lateral heterogeneity A burst of recent research has shown that bilayers whose leaflets differ in their physical properties such as composition phase state or lateral stress exhibit many fascinating new characteristics but also pose a host of new challenges related to their creation characterization simulation and theoretical description Chapters in this new release include Evaluation of functional transbilayer coupling in live cells by controlled lipid exchange and imaging FCS Effects of lateral and hydrostatic pressure on membrane structure and properties and much more Other sections cover Using the yeast vacuole as a system to test the lipid drivers of membrane heterogeneity in living cells Direct quantification of cellular membrane lipids using ratiometric fluorescence sensors The spectral phasor approach to resolving membrane order with environmentally sensitive dyes The use of hemifusion to create asymmetric giant unilamellar vesicles Insights on induced order domains Advanced microscopy methods to study membrane pores Use of cryo EM to study membrane phase separation and much more Explore the state of the art of lipid membrane asymmetry Covers experimental theoretical and computational techniques to create and characterize asymmetric lipid membranes Teaches how these kinds of approaches create and characterize laterally inhomogeneous membranes      **Membrane Structure and Function, Volume 4** EE Bittar (Ed), 1981
