**Phase Transitions in Polymers: The Role of Metastable States** Stephen Z.D. Cheng,2008-09-10 A classical metastable state possesses a local free energy minimum at infinite sizes but not a global one This concept is phase size independent We have studied a number of experimental results and proposed a new concept that there exists a wide range of metastable states in polymers on different length scales where their metastability is critically determined by the phase size and dimensionality Metastable states are also observed in phase transformations that are kinetically impeded on the pathway to thermodynamic equilibrium This was illustrated in structural and morphological investigations of crystallization and mesophase transitions liquid liquid phase separation vitrification and gel formation as well as combinations of these transformation processes The phase behaviours in polymers are thus dominated by interlinks of metastable states on different length scales This concept successfully explains many experimental observations and provides a new way to connect different aspects of polymer physics Written by a leading scholar and industry expert Presents new and cutting edge material encouraging innovation and future research Connects hot topics and leading research in one concise volume

Equilibrium Statistical Mechanics of Lattice Models David A. Lavis, 2015-01-31 Most interesting and difficult problems in equilibrium statistical mechanics concern models which exhibit phase transitions For graduate students and more experienced researchers this book provides an invaluable reference source of approximate and exact solutions for a comprehensive range of such models Part I contains background material on classical thermodynamics and statistical mechanics together with a classification and survey of lattice models The geometry of phase transitions is described and scaling theory is used to introduce critical exponents and scaling laws An introduction is given to finite size scaling conformal invariance and Schramm Loewner evolution Part II contains accounts of classical mean field methods The parallels between Landau expansions and catastrophe theory are discussed and Ginzburg Landau theory is introduced The extension of mean field theory to higher orders is explored using the Kikuchi Hijmans De Boer hierarchy of approximations In Part III the use of algebraic transformation and decoration methods to obtain exact system information is considered This is followed by an account of the use of transfer matrices for the location of incipient phase transitions in one dimensionally infinite models and for exact solutions for two dimensionally infinite systems The latter is applied to a general analysis of eight vertex models yielding as special cases the two dimensional Ising model and the six vertex model The treatment of exact results ends with a discussion of dimer models In Part IV series methods and real

space renormalization group transformations are discussed The use of the De Neef Enting finite lattice method is described in detail and applied to the derivation of series for a number of model systems in particular for the Potts model The use of Pad e differential and algebraic approximants to locate and analyze second and first order transitions is described The realization of the ideas of scaling theory by the renormalization group is presented together with treatments of various approximation schemes including phenomenological renormalization Part V of the book contains a collection of mathematical appendices intended to minimise the need to refer to other mathematical sources
