Order and Fluctuations in Collective Dynamics of Swimming Bacteria Daiki Nishiguchi,2020-01-31 This thesis focuses on experimental studies on collective motion using swimming bacteria as model active matter systems It offers comprehensive reviews of state of the art theories and experiments on collective motion from the viewpoint of nonequilibrium statistical physics The author presents his experimental studies on two major classes of collective motion that had been well studied theoretically Firstly swimming filamentous bacteria in a thin fluid layer are shown to exhibit true long range orientational order and anomalously strong giant density fluctuations which are considered universal and landmark signatures of collective motion by many numerical and theoretical works but have never been observed in real systems Secondly chaotic bacterial turbulence in a three dimensional dense suspension without any long range order as described in the first half is demonstrated to be capable of achieving antiferromagnetic vortex order by imposing a small number of constraints with appropriate periodicity The experimental results presented significantly advance our fundamental understanding of order and fluctuations in collective motion of motile elements and their future applications
