a survey and conclusions on the action of proteinase enzymes which are cleaving proteins or peptides. The specificity of proteinases which is determined as the sequence of amino acids at the cleavage site of a substrate is an important criteria to choose an enzyme as tool in protein research. Whenever one is looking for an enzyme to act at a defined site or to give defined cleavage products one will find comprehensive information in this work. Comprehensive information about more than 280 endopeptidases which are based on the database LYSIS including a calculation program to determine cleavage sites is given in the book *High Pressure in Semiconductor Physics II*, 1998-08-17. Since its inception in 1966 the series of numbered volumes known as Semiconductors and Semimetals has distinguished itself through the careful selection of well known authors, editors and contributors. The Willardson and Beer Series as it is widely known has succeeded in publishing numerous landmark volumes and chapters. Not only did many of these volumes make an impact at the time of their publication but they continue to be well cited years after their original release. Recently Professor Eicke R. Weber of the University of California at Berkeley joined as a co editor of the series. Professor Weber, a well known expert in the field of semiconductor materials, will further contribute to continuing the series tradition of publishing timely, highly relevant and long impacting volumes. Some of the recent volumes such as Hydrogen in Semiconductors, Imperfections in III-V Materials, Epitaxial Microstructures, High Speed Heterostructure Devices, Oxygen in Silicon and others promise indeed that this tradition will be maintained and even expanded. Reflecting the truly interdisciplinary nature of the field that the series covers, the volumes in Semiconductors and Semimetals have been and will continue to be of great interest to physicists, chemists, materials scientists and device engineers in modern industry. Volumes 54 and 55 present contributions by leading researchers in the field of high pressure semiconductors. Edited by T. Suski and W. Paul, these volumes continue the tradition of well known but outdated publications such as Brigman's *The Physics of High Pressure* 1931 and 1949 and *High Pressure Physics and Chemistry* edited by Bradley. Volumes 54 and 55 reflect the industrially important recent developments in research and applications of semiconductor properties and behavior under desirable, risk free conditions at high pressures. These developments include the advent of the diamond anvil cell technique and the availability of commercial piston/cylinder apparatus operating at high hydrostatic pressures. These much needed books will be useful to both researchers and practitioners in applied physics, materials science and engineering.

Robotic Exploration of the Solar System Paolo Ulivi, David M. Harland, 2012-08-14. Paolo Ulivi and David Harland provide in *Robotic Exploration of the Solar System* a detailed history of unmanned missions of exploration of our Solar System. The subject is treated from an engineering and scientific standpoint. Technical descriptions of the spacecraft, of their mission designs and of instrumentations are provided. Scientific results are discussed in considerable depth together with details of mission management. The project will deliver four volumes totaling over 2 000 pages that will provide comprehensive coverage of the topic with thousands of references to the professional literature that should make it the first port of call for people seeking information on the topic. The books will

cover missions from the 1950s until the present day and some of the latest missions and their results will appear in a popular science book for the first time
