Managing Complexity Through Social Intelligence Jeremy Horne, 2023-03-07 This book presents solutions to problems that are total and based on thinking about how and why humans have organized themselves It discusses how to avoid the now well documented Holocene Extinction propelled by climate change wars resource depletion desertification degrading knowledge quality famine and deterioration of societies overall It explains why we cannot respond effectively with hedonistic incompetent corrupt and anarchistic liberal democracy and why neither personality cult regimes can suffice The book offers a model of an organic social structure embodying a collective consciousness of communitarianism and Platonic style ethos Putting an emphasis on the re establishment of Classical Greek virtue it offers solutions to resolve identity politics alienation and meritocracy While doing so the author opposes the everyone is equal ideology to govern the section of policymakers instead circumscribing rights in terms of responsibilities prioritizing education and training to carry forth the ethos of valuing truth above materialism and developing Durkheim s social brain via a new discipline sociointelligence The book goes on to explain how underpinning these elements is a comprehensive elucidation of often misunderstood words like liberty freedom authoritarianism and democracy All of these areas are arranged and combined in uniquely describing the organic society the author deems necessary to avoid human extinction As a result the book presents a new organicity where the emerging transhumanism seeks to transcend hydrocarbon based life with humanly constructed life This book will appeal to students researchers and scholars of political science philosophy and the social sciences interested in a better understanding of complexity democratic theory Holocene Extinction organic thinking and meritocratic societies **Amorphous and Nanocrystalline Silicon Science and Technology ...** ,2004 **Char oil energy development** FMC Corporation. Non-Equilibrium Charge Motion in Organic Solar Cells Armantas

Melianas, 2017-04-18 Organic photovoltaic OPV devices based on semiconducting polymers and small molecules allow for a low cost alternative to inorganic solar cells Recent developments show power conversion efficiencies as high as 10-12% highlighting the potential of this technology Nevertheless further improvements are necessary to achieve commercialization To a large extent the performance of these devices is dictated by their ability to extract the photo generated charge which is related to the charge carrier mobility Various time resolved and steady state techniques are available to probe the charge carrier mobility in OPVs but often lead to different mobility values for one and the same system Despite such conflicting observations it is generally assumed that charge transport in OPV devices can be described by well defined charge carrier mobilities typically obtained using a single steady state technique This thesis shows that the relevance of such well defined mobilities for the charge separation and extraction processes is very limited Although different transient techniques probe different time scales after photogeneration they are mutually consistent as they probe the same physical mechanism governing charge motion gradual thermalization of the photo generated carriers in the disorder broadened density of states DOS The photo generated carriers gradually lose their excess energy during transport to the extracting electrodes but not immediately Typically not all excess energy is dissipated as the photo generated carriers tend to be extracted from the OPV device before reaching quasi equilibrium Carrier motion is governed by thermalization leading to a time dependent carrier mobility that is significantly higher than the steady state mobility This picture is confirmed by several transient techniques Time resolved Terahertz Spectroscopy TRTS Time resolved Microwave Conductance TRMC combined with Transient Absorption TA electrical extraction of photo induced charges photo CELIV The connection between transient and steady state mobility measurements space charge limited conductivity SCLC is described Unification of transient opto electric techniques to probe charge motion in OPVs is presented Using transient experiments the distribution of extraction times of photo

generated charges in an operating OPV device has been determined and found to be strongly dispersive spanning several decades in time In view of the strong dispersion in extraction times the relevance of even a well defined time dependent mean mobility is limited In OPVs a continuous percolating donor network is often considered necessary for efficient hole extraction whereas if the network is discontinuous hole transport is thought to deteriorate significantly limiting device performance Here it is shown that even highly diluted donor sites 5 7 10 % in a buckminsterfullerene C60 matrix enable reasonably efficient hole transport Using transient measurements it is demonstrated that hole transport between isolated donor sites can occur by long range hole tunneling over distances of 4 nm through several C60 molecules even a discontinuous donor network enables hole transport
