Automated Web Site Evaluation M.Y. Ivory,2013-06-29 Among all information systems that are nowadays available web sites are definitely the ones having the widest potential audience and the most significant impact on the everyday life of people Web sites contribute largely to the information society they provide visitors with a large array of services and information and allow them to perform various tasks without prior assumptions about their computer literacy Web sites are assumed to be accessible and usable to the widest possible audience Consequently usability has been recognized as a critical success factor for web sites of every kind Beyond this universal recognition usability still remains a notion that is hard to grasp Summative evaluation methods have been introduced to identify potential usability problems to assess the quality of web sites However summative evaluation remains limited in impact as it does not necessarily deliver constructive comments to web site designers and developers on how to solve the usability problems Formative evaluation methods have been introduced to address this issue Evaluation remains a process that is hard to drive and perform while its potential impact is probably maximal for the benefit of the final user This complexity is exacerbated when web sites are very large potentially up to several hundreds of thousands of pages thus leading to a situation where evaluating the web site is almost impossible to conduct manually Therefore many attempts have been made to support evaluation with Models that capture some characteristics of the web site of interest

People and Computers XIX - The Bigger Picture Tom McEwan,Jan Gulliksen,David Benyon,2007-12-20 As a new medium for questionnaire delivery the Internet has the potential to revolutionize the survey process Online Web based questionnaires provide several advantages over traditional survey methods in terms of cost speed appearance flexibility functionality and usability Bandilla et al 2003 Dillman 2000 Kwak they can incorporate links and it is possible to encode difficult skip patterns making such patterns virtually invisible to respondents Despite this and the emergence of numerous tools to support online questionnaire creation current electronic survey design typically replicates the look and feel of pap based questionnaires thus failing to harness the full power of the electronic survey medium A recent environmental scan of online questionnaire design tools found that little if any support is incorporated within these tools to guide questionnaire design according to best practice Lumsden Morgan 2005 This paper

briefly introduces a comprehensive set of guidelines for the design of online questionnaires It then focuses on an informal observational study that has been conducted as an initial assessment of the value of the set of guidelines as a practical reference guide during online questionnaire design 2 Background Online questionnaires are often criticized in terms of their vulnerability to the four standard survey error types namely coverage non response sampling and measurement errors

Product Research N. R. Srinivasa Raghavan,John A. Cafeo,2010-03-11 7 1 1 Background Uncertainty can be considered as the lack of adequate information to make a decision It is important to quantify uncertainties in mathematical models used for design and optimization of nondeterministic engineering systems In general certainty can be broadly classified into three types Bae et al 2004 Ha Rok 2004 Klir and Wierman 1998 Oberkampff and Helton 2002 Sentz 2002 The first one is aleatory uncertainty also referred to as stochastic uncertainty or inherent certainty it results from the fact that a system can behave in random ways For example the failure of an engine can be modeled as an aleatory uncertainty because the failure can occur at a random time One cannot predict exactly when the engine will fail even if a large quantity of failure data is gathered

available The second one is epistemic uncertainty also known as subjective uncertainty or reducible certainty it is the uncertainty of the outcome of some random event due to lack of knowledge or information in any phase or activity of the modeling process By gaining information about the system or environmental factors one can reduce the epistemic uncertainty For example a lack of experimental data to characterize new materials and processes leads to epistemic uncertainty

Human-Centered Software Engineering - Integrating Usability in the Software Development Lifecycle Ahmed Seffah, Jan Gulliksen, Michel C. Desmarais, 2006-06-26 Human Centered Software Engineering Bridging HCI Usability and Software Engineering From its beginning in the 1980 s the field of human computer interaction HCI has been a multidisciplinary arena By this I mean that there has been an explicit recognition that distinct skills and perspectives are required to make the whole effort of designing usable computer systems work well Thus people with backgrounds in Computer Science CS and Software Engineering SE joined with people with backgrounds in various behavioral science disciplines e g cognitive and social psychology anthropology in an effort where all perspectives were seen as essential to creating usable systems But while the field of HCI brings individuals with many background disciplines together to discuss a common goal the development of useful usable satisfying systems the form of the collaboration remains unclear Are we striving to coordinate the varied activities in system development or are we seeking a richer collaborative framework In coordination Usability and SE skills can remain quite distinct and while the activities of each group might be critical to the success of a project we need only insure that critical results are provided at appropriate points in the development cycle Communication by one group to the other during an activity might be seen as only minimally necessary In collaboration there is a sense that each group can learn something about its own methods and processes through a close partnership with the other Communication during the process of gathering information from target users of a system by usability professionals would not be seen as so thing that gets in the way of the essential work of software engineering professionals
