

Neuron Structure

What are the essential structures that make up a neuron?

Why?

Cells are specialized for different functions in multicellular organisms. In animals, one unique kind of cell helps organisms survive by collecting information and sending messages throughout the body. The shapes and features of neurons, which are the primary cells in the nervous system, enable animals to experience all of the five senses; find food, mates, and shelter; and to survive in their diverse environments.

Model 1 – Parts of a Neuron

1. Model 1 is an illustration of two neurons. Label one of the neurons in the diagram with the following structures:

Cell body or soma

Axon

Cell nucleus

Synapse

Dendrites

See Model 1.

2. Which structure(s) on the neuron in Model 1 would receive a signal from either a sensory cell (taste bud, touch receptor, retinal cell) or from another neuron?

The dendrites receive the signal from other cells.

3. Draw an arrow through the two cells in Model 1 to show the path of a nerve impulse if a message was being sent through the two neurons.

See dotted line in Model 1.

Neuron Structure of the Brain Grigoriĭ Izrailevich Poliakov,1972 *Neuron Structure of the Brain* Grigoriĭ Izrailevich Poliakov,1972 **Neuron Structure of the Brain, Engl** G. I. Poljakov,1972 **The Generalized Vertebrate Neuron** David Bodian,1962 Mind at Rest Maryam Shahzad,2024-02-16 Exploring the Brain s Intricacies An Introduction to Neuron Structure and Sleep An astonishingly sophisticated organ the human brain is responsible for a plethora of life sustaining processes A network of neurons the basic units responsible for information transmission within the brain is at the core of its activities Neuronal architecture is a key to understanding many cognitive and physiological processes including sleep the most mysterious human experience Building Blocks of Neurons The Brain s Architectural Mysteries A nervous system s principal functional unit is a neuron also called a nerve cell The brain is an enormous network that enables the transmission of impulses at lightning speed it is composed of billions of these complex cells Multiple parts all of which are essential to the neuron s operation make up a normal neuron The cell body often called the soma is the nucleus of the neuron It is home to the cell s genetic material and regulatory center the nucleus It is the job of the cell body to process incoming signals and determine if an electrical impulse should be transmitted The dendrites are the parts of a neuron that extend outward from the cell body and receive impulses sent by neighboring neurons These complex networks enhance the amount of surface area that may be used for synaptic connections which are the building blocks of neuronal communication **Structure and Connections of Neurons** Santiago Ramón y Cajal,Cyril Brian Courville,Leon Lampell,1952 *A Method for Neuron Detection and Characterization* Heechang Kim,2011 The main goal of the thesis is to propose a method for neuron detection and characterization applied to neuroscience studies in need of extracting global and local information regarding neuron morphology in two dimensional image slices acquired through fluorescence confocal microscopy Difficulties faced in dealing with neuron detection for such images arise from morphological complexity of local neuronal structures and image data For example a neuron is composed of largely two distinct structures cell body and neurite which exhibit different morphological cues However numerous neuroscience studies often require for detection methods to distinguish the two structures for the purpose of obtaining local morphometric measures while retaining the overall structure for the purpose of extracting global topological measures This mandates extraction of neuronal structures requiring different detection methods Furthermore variabilities of local and global neuronal phenotype such as cell body shapes sizes neurite lengths thicknesses and curvatures along neurite structures hamper detection process There also lies difficulties in regards to image data Due to reasons such as photobleaching poor localization disruptions of protein functions locally dead neurite structures out of focus plane structures local thinning of neurite structures and or strong background noise intensity in relevant neuronal structures may be inconsistent An ideal confocal neuron image contains cell body region distinguishable by significantly higher intensity values

compared to its neurite structures. However, due to the listed reasons above, the cell body region may have similar or even lower contrast. Additionally, inconsistent intensity values may result in morphological cues that are similar to neurite structures inside the cell body region and easily observable discontinuous neurites. In approaching such difficulties, the thesis presents methods in progressive stages of neuron detection, including neuronal cell body detection, neurite structure detection, and discontinuous neurite reconstruction. In addition, it proposes a Vector Graph (VG) based Neuron Graph Model (NGM) in which 1) detected local structures are incorporated into a single structure withholding morphometric measures, 2) various active contour models may be applied to different parts of the local neuronal structures, and 3) characterization and validation are carried out through conversion of NGM to Neuron Tree (NT). For cell body detection, neuronal image data in which the cell body region may not be segmented via intensity thresholding methods are addressed. Neurite centerline detection comprises the main part of the thesis, where a new partial gestalt for centerline detection and a novel active contour energy is proposed for evolution of line segments to the centerline of the neurite structures. A method for reconstructing discontinuous neurites iteratively searches and extends detected neurite structures by recovering the local curve structure cues from three vector fields: the diffusion tensor vector field, the Hessian eigenvector field, and the diffused gradient vector field. Further topics of interest presented are characterization and validation framework for the proposed neuron detection method. Characterization involves both local morphometric and global neurite topology analysis, including cell body area, perimeter, shape, neurite length, thickness, and overall connectivity patterns of the neurite. We propose to use Neuron Tree derived from Neuron Graph, where local and global measures may be obtained. Neuron Tree is also used in the validation framework in measuring the accuracy of the proposed detection method with a set of artificial neuron images. By recursively computing tree edit distance between subtrees of the Neuron Tree for artificial neuron image and subtrees of detected one, the validation framework is able to measure detection errors in local morphometric and overall structural detection errors.
