iron riders are very efficient aids against hogging strains which are those most injurious to wood ships When hogging takes place the ends must drop relatively to the middle a change of form which would bring the iron riders under tensile strains the kind of strains which they are best fitted to resist Against compressive strains these thin narrow bands of iron cannot be nearly so efficient as against tensile strains so that as commonly fitted riders are not of much service against sagging strains except amidships where the two systems overlap one another It is amidships that the severest strains are experienced so that the crossing of the riders there is a great advantage Composite ships of the mercantile marine were usually built with a single thickness of planking and consequently needed diagonal strengthened One common plan of fitting these was to have rider plates riveted outside the iron frames and inclined 45 degrees to the vertical The upper ends of those riders were attached to the sheer strake and the lower to another detached longitudinal tie formed by a strake of plating worked at the bilge Composite ships of the Royal Navy are built with their outside planking in two thicknesses The edge seams of the planks in the inner thickness are each covered by a plank of the outer thickness the seams of the outer thickness are similarly covered by the planks of the inner thickness A strong edgewise connection is thus made in the double skin and consequently diagonal rider plates are dispensed with Other composite ships have been constructed with the skin planking in two thicknesses one or both of which had the planks worked diagonally it was then unnecessary to fit diagonal rider plates to

**Architecture** William Henry White, 2017-07-27 Excerpt from A Manual of Naval Architecture For the Use of Officers of the Royal Navy Officers of the Mercantile Marine Shipbuilders and Shipowners Tms book has been undertaken in the hope that it may supply a want in the literature of naval architecture Existing treatises have been written mainly for the use of those who desired to obtain the knowledge of the subject required in the practice of ship designing in all or nearly all these books mathematical language is freely used and without a considerable knowledge of mathematics no one can follow the reasoning My work at the Royal Naval College has however shown me that outside the profession of the naval architect there are to be found very many persons more or less intimately connected with shipping who desire to obtain acquaintance with the principles of ship construction but cannot obtain the information from existing text books Officers of the Royal Navy have repeatedly asked me to recommend a book which contained in popular language a comprehensive summary of the theory of naval architecture Being unable to name such a book and feeling confident that the desire expressed by 015 core of the Royal

Navy will be shared by many officers of the mercantile marine as well as shipbuilders shipowners and others I decided to attempt the task now completed I venture to hope that the work may be found acceptable also as an introduction for students to the more mathematical treatment of the subject contained in other works and that even naval architects themselves may find some valuable information herein About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works
