## Earth's Atmosphere Layers

The Earth's atmosphere is like a protective blanket of gases that wrap around our planet. Imagine it as a cozy layer of air that extends high above the Earth's surface. This atmosphere is what makes life on Earth possible. In total, our atmosphere can be divided into five different layers. Each layer has its unique characteristics and plays a vital role in keeping our planet safe and habitable.

**Troposphere:** This is the layer closest to the Earth's surface, where we live and where all our weather happens. It's like the layer of air right around us. As you go up in the troposphere, the temperature gets cooler.

**Stratosphere:** Just above the troposphere lies the stratosphere. It extends from about 12 kilometers (7.5 miles) to about 50 kilometers (31 miles) high. What's fascinating about the stratosphere is the presence of the ozone layer, which absorbs harmful ultraviolet radiation from the sun. This layer gets warmer as you move higher up!

**Mesosphere:** Moving higher up, we reach the mesosphere, which extends from about 50 kilometers (31 miles) to about 85 kilometers (53 miles) high. It's the coldest layer of the atmosphere, and the temperature decreases with altitude.

**Thermosphere:** Beyond the mesosphere, you'll find the thermosphere, which stretches from about 85 kilometers (53 miles) to about 600 kilometers (373 miles) high. Here, things start heating up again because of the absorption of solar radiation by atoms and molecules.

**Exosphere:** Finally, we have the exosphere, which is the outermost layer of the atmosphere. It extends from about 600 kilometers (373 miles) to about 10,000 kilometers (6,213 miles) high. This layer is where our atmosphere gradually merges with the emptiness of space.
