Web-Based Control and Robotics Education Spyros G. Tzafestas, 2009-07-31 For the things we have to learn before we can do them we learn by doing them Aristotle Teaching should be such that what is offered is perceived as a valuable gift and not as a hard duty Albert Einstein The second most important job in the world second only to being a good parent is being a good teacher S G Ellis The fast technological changes and the resulting shifts of market conditions require the development and use of educational methodologies and opportunities with moderate economic demands Currently there is an increasing number of educational institutes that respond to this challenge through the creation and adoption of distance education programs in which the teachers and students are separated by physical distance It has been verified in many cases that with the proper methods and tools teaching and learning at a distance can be as effective as traditional face to face instruction Today distance education is primarily performed through the Internet which is the biggest and most powerful computer network of the World and the World Wide Web WWW which is an effective front end to the Internet and allows the Internet users to uniformly access a large repertory of resources text data images sound video etc available on the Internet

Microsystem Design Stephen D. Senturia, 2005-12-20 It is a real pleasure to write the Foreword for this book both because I have known and respected its author for many years and because I expect this book's publication will mark an important milestone in the continuing worldwide development of microsystems By bringing together all aspects of microsystem design it can be expected to facilitate the training of not only a new generation of engineers but perhaps a whole new type of engineer one capable of addressing the complex range of problems involved in reducing entire systems to the micro and nano domains This book breaks down disciplinary barriers to set the stage for systems we do not even dream of today Microsystems have a long history dating back to the earliest days of mic electronics While integrated circuits developed in the early 1960s a number of laboratories worked to use the same technology base to form integrated sensors The idea was to reduce cost and perhaps put the sensors and circuits together on the same chip By the late 60s integrated MOS photodiode arrays had been developed for visible imaging and silicon etching was being used to create thin diaphragms that could convert pressure into an electrical signal By 1970 selective anisotropic etching was being used for diaphragm formation retaining a thick silicon rim to absorb package induced stresses Impurity and electrochemically based etch stops soon emerged and bulk micromachining came into its own
