*Ocean Modeling and Parameterization* Eric P. Chassignet, Jacques Verron, 2012-12-06 The realism of large scale numerical ocean models has improved dramatically in recent years in part because modern computers permit a more faithful representation of the differential equations by their algebraic analogs Equally significant if not more so has been the improved understanding of physical processes on space and time scales smaller than those that can be represented in such models Today some of the most challenging issues remaining in ocean modeling are associated with parameterizing the effects of these high frequency small space scale processes Accurate parameterizations are especially needed in long term integrations of coarse resolution ocean models that are designed to understand the ocean variability within the climate system on seasonal to decadal time scales Traditionally parameterizations of subgrid scale high frequency motions in ocean modeling have been based on simple formulations such as the Reynolds decomposition with constant diffusivity values Until recently modelers were concerned with first order issues such as a correct representation of the basic features of the ocean circulation As the numerical simulations become better and less dependent on the discretization choices the focus is turning to the physics of the needed parameterizations and their numerical implementation At the present time the success of any large scale numerical simulation is directly dependent upon the choices that are made for the parameterization of various subgrid processes

**From Cold Seeps to Hydrothermal Vents: Geology, Chemistry, Microbiology, and Ecology in Marine and Coastal Environments** Glen T. Snyder,Stéphanie Dupré,Carolyn Ruppel,Marcelo Ketzer ,Andrew R. Thurber,2024-10-17 Seafloor fluid and gas emission has been revealed to be a geographically widespread phenomenon in recent years as

researchers have discovered new off axis hydrothermal vent fields and previously unmapped shallow deltaic continental shelf and deep water cold seeps Seafloor seep emissions play a critical role in global biogeochemical cycles but also contribute to the development of economically important mineral deposits that are increasingly targeted for exploitation Hydrothermal vents and cold seeps host unique microbiological and macrofaunal communities that provide clues to life on primordial Earth and seafloor fluid and gas emissions play a complex role in microbial dispersal ocean chemistry plankton dynamics and possibly global climate This Research Topic will address the knowledge gaps about the linked chemistry macro microbiology physics and geology of seafloor emissions and explore both the economic potential and conservation efforts associated with hydrothermal vents and cold seeps      Selected Water Resources Abstracts ,1991-10
