Papp, Codrutza Micu, 2007 The area of low dimensional quantum systems on discrete spaces is a rapidly growing research field lying at the interface between quantum theoretical developments like discrete and q difference equations and tight binding superlattice models in solid state physics Systems on discrete spaces are promising candidates for applications in several areas Indeed the dynamic

localization of electrons on the 1D lattice under the influence of an external electric field serves to describe time dependent transport in quantum wires linear optical absorption spectra and the generation of higher harmonics Odd even parity effects and the flux dependent oscillations of total persistent currents in discretized rings can also be invoked Technological developments are then provided by conductance calculations characterizing 1D conductors junctions between rings and leads or rings and dots and by quantum LC circuits Accordingly the issues presented in this book are important starting points for the design of novel nanodevices
