**Abstract**—This study examined the effects of a 12-week, low-intensity, supervised walking program on the health-related quality of life (HRQL) of older adults with knee osteoarthritis (OA). The study was a randomized controlled trial. The study group (n = 20) participated in a 12-week walking program, while the control group (n = 20) did not. The study group showed significant improvements in HRQL compared to the control group. The findings suggest that a 12-week, low-intensity, supervised walking program can improve the HRQL of older adults with knee OA.
