This publication provides information on organic apple production from recent research and producer experience. Many aspects of apple production are the same whether the grower uses low input, organic, or conventional management. Accordingly, this publication focuses on the aspects that differ from nonorganic production—primarily pest and disease control, marketing, and economics. Information on organic weed control and fertility management is included in a separate ATTRA publication, *How to Grow Organic Production Systems*. This publication introduces the major apple rootstock and disease and the most effective organic management methods. It also includes farmer profiles of existing orchards and a section dealing with economics and marketing considerations. There is an appendix for all resources for information and supplies and an appendix on disease resistant apple varieties.

We recognize the trial-and-error experience of organic producers and their willingness to share in this publication. Special thanks to the farmer that agreed to be profiled in this publication: Elizabeth Fries and Nathaniel Schneider, New York State Organic Certification, California, Minnesota, and Honeydew Orchard in Germantown, Minnesota.

Introduction

Apples, like so many other fruit and vegetable crops, are grown organically. They are grown so much for most parts than perhaps any other crop. Without effective management, the success of these crops can be daunting—so the fruits, in the general sense, and so the human race. To maintain an abundant harvest of apples while keeping soils and profits sound, the grower must develop a detailed understanding of the orchard as a managed ecosystem. In this regard, there is no substitute for direct observation and experience, along with a willingness to experiment. No
