18/10

Communicable diseases are spread between individuals by direct contact, indirectly, but always via a reservoir for pathogens, usually, but not always, water. Pathogens are spread by contact with the reservoir, which may be the infected body, or the spread of spores.

**Emerging and Endemic Pathogens** Kevin P. O'Connell,Evan W. Skowronski,Lela Bakanidze,Alexander Sulakvelidze,2010-08-25 It is a truism among biologists that an organism s phenotype is the product of both its genotype and its environment An organism s genotype contains the total informational potential of the individual while its environment shapes the expression of the ge type influences the rate of mutation and occurrence of

modifications and ultimately determines the likelihood that the genotype or fractions thereof will survive into the next generation. In the relationship between host and pathogen, therefore, each forms a part of the environment of the other, mutually influencing the biology of both partners on scales ranging from the life history of individuals to the fate of populations or entire species. Molecular biologists working on problems in pathogenesis generally think of the host organism as the pathogen's environment and perhaps occasionally consider the pathogen as part of the host's environment. However, because environment can be defined at many scales, so too can phenotypes. If a pathogen as a species is considered to exist in a host as a species, then among its phenotypes is the nature of the pandemic disease it can cause within the host community. The contributors to the proceedings of this NATO Advanced Research Workshop have treated the interplay of environment and genotype in the host-pathogen relationship and its relationship to the problem of emerging infectious disease at both the macroscopic and microscopic/molecular levels along this continuum of scale, with some human history thrown in at times for good measure.
