The Statistical Analysis Of Recurrent Events:

The Statistical Analysis of Recurrent Events Richard J. Cook, Jerald Lawless, 2007-08-02 This book presents models and statistical methods for the analysis of recurrent event data. The authors provide broad detailed coverage of the major approaches to analysis while emphasizing the modeling assumptions that they are based on. More general intensity based models are also considered as well as simpler models that focus on rate or mean functions. Parametric nonparametric and semiparametric methodologies are all covered with procedures for estimation testing and model checking.

Statistical Analysis of Panel Count Data Jianguo Sun, Xingqiu Zhao, 2013-10-09 Panel count data occur in studies that concern recurrent events or event history studies when study subjects are observed only at discrete time points. By recurrent events we mean the event that can occur or happen multiple times or repeatedly. Examples of recurrent events include disease infections, hospitalizations in medical studies, warranty claims of automobiles or system break downs in reliability studies. In fact many other fields yield event history data too such as demographic studies, economic studies and social sciences. For the cases where the study subjects are observed continuously the resulting data are usually referred to as recurrent event data. This book collects and unifies statistical models and methods that have been developed for analyzing panel count data. It provides the first comprehensive coverage of the topic. The main focus is on methodology but for the benefit of the reader the applications of the methods to real data are also discussed along with numerical calculations. There exists a great deal of literature on the analysis of recurrent event data. This book fills the void in the literature on the analysis of panel count data. This book provides an up to date reference for scientists who are conducting research on the analysis of panel count data. It will also be instructional for those who need to analyze panel count data to answer substantive research questions. In addition it can be used as a text for a graduate course in statistics or biostatistics that assumes a basic knowledge of probability and statistics.

The Statistical Analysis of Interval-censored Failure Time Data Jianguo Sun, 2007-05-26 This book collects and unifies statistical models and methods that have been proposed for analyzing interval censored failure time data. It provides the first comprehensive coverage of the topic of interval censored data and complements the books on right censored data. The focus of the book is on nonparametric and semiparametric inferences but it also describes parametric and imputation approaches. This book provides an up to date reference for people who are conducting research on the analysis of interval censored failure time data as well as for those

who need to analyze interval censored data to answer substantive questions *The Statistical Analysis of Failure Time Data* John D. Kalbfleisch, Ross L. Nelson, 2003-01-01 Survival data consist of a single event for each population unit namely end of life which is modeled with a life distribution In contrast many applications involve repeated events data where a unit may accumulate any number of events over time Examples include the number and cost of repairs of products the number and treatment costs of recurrent disease episodes in patients and the number of childbirths to statisticians This applied book provides practitioners with basic nonparametric methods for such data particularly the plot of the estimate of the population mean cumulative function MCF which yields most of the information sought Recurrent Events Data Analysis for Product Repairs Disease Recurrences and Other Applications is the first book to present a simple unified theory that includes data on costs or other values of discrete events not just the number of events It surveys computer programs that calculate and plot the MCF estimate with confidence limits shows their output and explains how to interpret such plots Many such calculations can be easily done with a pocket calculator or spreadsheet program Also the book introduces basic Poisson and Cox regression models and parametric models including homogeneous and nonhomogeneous Poisson processes and renewal processes International Encyclopedia of Statistical Science Miodrag Lovric, 2025-06-19 The International Encyclopedia of Statistical Science stands as a monumental effort to enrich statistics education globally particularly in regions facing educational challenges By amalgamating the expertise of over 700 authors from 110 countries including Nobel Laureates and presidents of statistical societies it offers an unparalleled resource for readers worldwide This encyclopedia is not just a collection of entries it is a concerted effort to revive statistics as a vibrant critical field of study and application Providing a comprehensive and accessible account of statistical terms methods and applications it enables readers to gain a quick insight into the subject regardless of their background This work serves to refresh and expand the knowledge of researchers managers and practitioners highlighting the relevance and applicability of statistics across various fields from economics and business to healthcare and public policy Furthermore it aims to inspire students by demonstrating the significance of statistics in solving real world problems thus encouraging a new generation to explore and contribute to the field *Biopharmaceutical Applied Statistics Symposium* Karl E. Survival and Event History Analysis Odd Aalen, Ornulf Borgan, Hakon Gjessing, 2008-09-16. The aim of this book is to bridge the gap between standard textbook models and a range of models where the dynamic structure of the data manifests itself fully. The common denominator of such models is stochastic processes. The authors show how counting processes, martingales and stochastic integrals fit very nicely with censored data. Beginning with standard analyses such as Kaplan Meier plots and Cox regression, the presentation progresses to the additive hazard model and recurrent event data. Stochastic processes are also used as natural models for individual frailty; they allow sensible interpretations of a number of surprising artifacts seen in population data. The stochastic process framework is naturally connected to causality. The authors show how dynamic path analyses can incorporate many modern causality ideas in a framework that takes the time aspect seriously. To make the material accessible to the reader, a large number of practical examples, mainly from medicine, are developed in detail. Stochastic processes are introduced in an intuitive and non-technical manner. The book is aimed at investigators who use event history methods and want a better understanding of the statistical concepts. It is suitable as a textbook for graduate courses in statistics and biostatistics.
