How do ecosystems develop over time?

Why?

On May 18, 1980, Mount St. Helens in the state of Washington erupted with the force of a hydrogen bomb. The volcano had been dormant for over 120 years, but now 57 people were dead and forests and lakes were totally destroyed, including nearby Spirit Lake, which became a mud hole. The blast leveled trees in areas over 10 miles from the crater and ash deposits suffocated life on the mountain. However, within weeks, mammals that had taken shelter underground started to reappear in the area, and now, over thirty years later, many areas of the mountain are colonized with a large variety of plant and animal life. How does an area move from a sterile, barren wilderness to one full of life?

Model 1 – Primary Succession

Barren rock from beneath a retreating glacier, or due to a volcanic eruption.

pioneer community

Low-growing plants such as mosses, ferns, and lichens begin to colonize.

seral stage

Fast-growing grasses, flowering plants, and small shrubs begin to take root. A thin layer of soil develops.

Fast-growing trees such as birch and mountain ash form a low forest and shade out lower plants.

climax community

100–200 years since colonization began, large, slow-growing trees, such as an oak, become established.

Survival of the fittest is a tautology because those that are fit are the ones that survive but to survive a species must be fit Modern evolutionary theory avoids the problem by defining fitness as reproductive success but the complexity of life that we see today could not have evolved based on selection that favors only reproductive ability There is nothing inherent in reproductive success alone that could result in higher forms of life Evolution from a Thermodynamic Perspective presents a non circular definition of fitness and a thermodynamic definition of evolution Fitness means maximization of power output necessary to survive in a competitive world Evolution is the storage of entropy Entropy storage means that solar energy instead of dissipating as heat in the Earth is stored in the structure of living organisms and ecosystems Part one explains this

in terms comprehensible to a scientific audience beyond biophysicists and ecosystem modelers Part two applies thermodynamic theory in non esoteric language to sustainability of agriculture and to conservation of endangered species While natural systems are stabilized by feedback agricultural systems remain in a mode of perpetual growth pressured by balance of trade and by a swelling population The constraints imposed by thermodynamic laws are being increasingly felt as economic expansion destabilizes resource systems on which expansion depends *Principles of Environmental Science and Engineering* Raju Ramrao Kulkarni,Yamini Narayan Deshvena,Samiyoddin Samshoddin Siddiqui,S. Schowalter,2013-05-23 With few exceptions insects are perceived in industrialized countries as undesirable pests In reality relatively few insects interfere with us or our resources Most have benign or positive effects on ecosystem services and many represent useful resources in non industrialized countries Challenging traditional perceptions of the value of insects Insects and Sustainability of Ecosystem

Services explores the ways insects affect the ecosystem services we depend upon. It also fosters an appreciation for the amazing diversity, adaptive ability, and natural roles of insects. The book discusses how the ways in which we manage insects will determine an ecosystem's capacity to continue to supply services. It reviews aspects of insect physiology, behavior, and ecology that affect their interactions with other ecosystem components and ecosystem services, emphasizing critical effects of insects on the sustainability of ecosystem processes and services. The author examines the integration of insect ecology with self-regulatory aspects of ecosystems that control primary production, energy, and nutrient fluxes, and global climate functions that underlie the sustainability of ecosystem services. Clearly, we need environmental policies that meet needs for pest control where warranted but do not undermine the important contributions of insects to sustaining ecosystem processes and services. With in-depth coverage of the multiple, often compensatory effects of insects on various resources or ecosystem services, and on the consequences of control tactics for those resources or services, *Insects and Sustainability of Ecosystem Services* recommends changes in perspectives and policies regarding insects that will contribute to sustainability of ecosystem services.

Regreening the Bare Hills David Lamb, 2010-10-14. In *Regreening the Bare Hills: Tropical Forest Restoration in the Asia Pacific Region*, David Lamb explores how reforestation might be carried out both to conserve biological diversity and to improve the livelihoods of the rural poor. While both issues have attracted considerable attention in recent years, this book takes a significant step by integrating ecological and silvicultural knowledge within the context of the social and economic issues that can determine the success or failure of tropical forest landscape restoration. Describing new approaches to the reforestation of degraded lands in the Asia Pacific tropics, the book reviews current approaches to reforestation throughout the region, paying particular attention to those which incorporate native species, including in multi-species plantations. It presents case studies from across the Asia Pacific region and discusses how the silvicultural methods needed to manage these new plantations will differ from conventional methods. It also explores how reforestation might be made more attractive to smallholders and how trade-offs between production and conservation are most easily made at a landscape scale. The book concludes with a discussion of how future forest restoration may be affected by some current ecological and socio-economic trends now underway. The book represents a valuable resource for reforestation managers and policy makers wishing to promote these new silvicultural approaches, as well as for conservationists, development experts, and researchers with an interest in forest restoration. Combining a theoretical research perspective with practical aspects of restoration, the book will be equally valuable to practitioners and academics, while the lessons drawn from these discussions will have relevance elsewhere throughout the tropics.
