**Energy Efficiency in Buildings** José Manuel Andújar,Sergio Gómez Melgar,2020-04-28 Buildings are one of the main causes of the emission of greenhouse gases in the world Europe alone is responsible for more than 30% of emissions or about 900 million tons of CO2 per year Heating and air conditioning are the main cause of greenhouse gas emissions in buildings Most buildings currently in use were built with poor energy efficiency criteria or depending on the country and the date of construction none at all Therefore regardless of whether construction regulations are becoming stricter the real challenge nowadays is the energy rehabilitation of existing buildings It is currently a priority to reduce or ideally eliminate the waste of energy in buildings and at the same time supply the necessary energy through renewable sources The first can be achieved by improving the architectural design construction methods and materials used as well as the efficiency of the facilities and systems the second can be achieved through the integration of renewable energy wind solar geothermal etc in buildings In any case regardless of whether the energy used is renewable or not the efficiency must always be taken into account The most profitable and clean energy is that which is not consumed

journals every year A search of simulation related papers and workshops through the proceedings of the last annual TRB meetings would support this assertion as would a review of the minutes from specially dedicated meetings such as the International Symposiums on Traffic Simulation Yokohama 2002 Lausanne 2006 Brisbane 2008 or the International Workshops on Traffic Modeling and Simulation Tucson 2001 Barcelona 2003 Sedona 2005 Graz 2008 Yet the only comprehensive treatment of the subject to be found so far is in the user's manuals of various software products
