**Biology of Microbial Infection** Reinhard Guthke, Jörg Linde, Marc Thilo Figge, Franziska Mech, The systems biology of microbial infections aims at describing and analysing the confrontation of the host with bacterial and fungal pathogens. It intends to understand and to model the interaction of the host in particular the immune system of humans or animals with components of pathogens. This comprises experimental studies that provide spatio-temporal data from monitoring the response of host and pathogenic cells to perturbations or when interacting with each other as well as the integrative analysis of genome-wide data from both the host and the pathogen. In perspective the host-pathogen interaction should be described by a combination of spatio-temporal models with interacting molecular networks of the host and the pathogen. The aim is to unravel the main mechanisms of pathogenicity to identify diagnostic biomarkers and potential drug targets and to explore novel strategies for personalized therapy by computer simulations. Some microorganisms are part of the normal microbial flora existing either in a mutualistic or commensal relationship with the host. Microorganisms become pathogenic if they possess certain physiological characteristics and virulence determinants as well as capabilities for immune evasion. Despite the different pathogenesis of infections there are several common traits:

- 1 Before infection pathogens must be able to overcome epithelial barriers. The infection starts by adhesion and colonization and is followed by entering of the pathogen into the host through the mucosa or injured skin.
- 2 Next infection arises if the pathogen multiplies and overgrows the normal microbial flora either at the place of entrance or in deeper tissue layers or organs.
- 3 After the growth phase the pathogen damages the host's cells, tissues and organs by producing toxins or destructive enzymes.

Thus systems biology of microbial infection comprises all levels of the pathogen and the host's immune system. The investigation may start with the pathogen: its adhesion and colonization at the host, its interaction with host cell types (e.g. epithelia cells, dendritic cells, macrophages, neutrophils, natural killer cells etc.). Because infection diseases are mainly found in patients with a weakened immune system (e.g. reduced activities of immune effector cells or defects in the epithelial barriers) systems biology of infection can also start with modelling of the immune defence including innate and adaptive immunity. Systems biological studies comprise both experimental and theoretical approaches. The experimental studies may be dedicated to reveal the relevance of certain genes or proteins in the above-mentioned processes on the side of the pathogen and/or the host by applying functional and biochemical analyses based on knock-out mutants and knock-down experiments. At the theoretical (i.e. mathematical and computational) side systems biology of microbial infection comprises:

- 1 modelling of molecular mechanisms of bacterial or fungal infections
- 2 modelling of non-protective and protective immune defences against microbial pathogens to generate information for possible immune therapy approaches
- 3 modelling of infection dynamics and identification of biomarkers for diagnosis and for individualized therapy
- 4 identifying essential virulence determinants and thereby predicting potential drug targets

colonization in tumor tissue Immunological alterations due to bacteria tumor tissue interaction      **Origins of Biodiversity**

Lindell Bromham, Marcel Cardillo, 2019 *Origins of Biodiversity* is a unique introduction to the fields of macroevolution and macroecology which explores the evolution and distribution of biodiversity across time space and lineages Using an enquiry led framework to encourage active learning and critical thinking each chapter is based around a case study to explore concepts and research methods from contemporary macroevolution and macroecology The book focuses on the process of science as much as the biology itself to help students acquire the research skills and intellectual tools they need to understand and investigate the biological world around them In particular the emphasis on hypothesis testing encourages students to develop and test their own ideas This text builds upon the foundations offered in most general introductory evolutionary biology courses to introduce an exciting range of ideas and research tools for investigating patterns of biodiversity      Acute/Chronic Pathogen Infections: Roles of Resident, Probiotic, and Live Biotherapeutic Microbes in

Limiting or Preventing Disease George Grant,, Jean-Philippe Lavigne, Alina Maria Holban, Meina Neumann-Schaal, 2025-02-28 Bacteria viruses fungi and protists are present on all epithelia of the human body including oral gut skin lung and vaginal and urinary tracts The most extensively studied bacteriome is that of the intestine in which the adult form contains more than 4 10<sup>13</sup> cells and up to 1000 different species At birth the gut bacteriome is simple and of low number but then expands rapidly in both number and diversity by around three days At this point when the lower bowel is anaerobic Bifidobacterium Clostridium and Bacteroides constitute most of the species The switch to solid foods drives further expansion and complexity in the bacteriome until it generally stabilises into an adult like form a high proportion of Bacillota formerly Firmicutes and Bacteroidota Bacteroidetes moderate levels of Actinomycetota Actinobacteria and low numbers of Cyanobacteria Fusobacteriota Pseudomonadota Proteobacteria Synergistota and Verrucomicrobiota by about two years of age
