Teaching Mathematics with Classroom Voting Kelly Slater Cline, Holly Zullo, 2012 Are you looking for new ways to engage your students Classroom voting can be a powerful way to enliven your classroom by requiring all students to consider a question discuss it with their peers and vote on the answer during class When used in the right way students engage more deeply with the material and have fun in the process while you get valuable feedback when you see how they voted But what are the best strategies to integrate voting into your lesson plans How do you teach the full curriculum while including these voting events How do you find the right questions for your students This collection includes papers from faculty at institutions across the country teaching a broad range of courses with classroom voting including college algebra precalculus calculus statistics linear algebra differential equations and beyond These faculty share their experiences and explain how they have used classroom voting to engage students to provoke discussions and to improve how they teach mathematics This volume should be of interest to anyone who wants to begin using classroom voting as well as people who are already using it but would like to know what others are doing While the authors are primarily college level faculty many of the papers could also be of interest to high school mathematics teachers Publisher description Modeling Life Alan Garfinkel, Jane Shevtsov, Yina Guo, 2017-09-06 This book develops the mathematical tools essential for students in the life sciences to describe interacting systems and predict their behavior From predator prey populations in an ecosystem to hormone regulation within the body the natural world abounds in dynamical systems that affect us profoundly Complex feedback relations and counter intuitive responses are common in nature this book develops the quantitative skills needed to explore these interactions Differential equations are the natural mathematical tool for quantifying change and are the driving force throughout this book The use of Euler s method makes nonlinear examples tractable and accessible to a broad spectrum of early stage undergraduates thus providing a practical alternative to the procedural approach of a traditional Calculus curriculum Tools are developed within numerous relevant examples with an emphasis on the construction evaluation and interpretation of mathematical models throughout Encountering these concepts in context students learn not only quantitative techniques but how to bridge between biological and mathematical ways of thinking Examples range broadly exploring the dynamics of neurons and the immune system through to population dynamics and the Google PageRank algorithm Each scenario relies only on an interest in the natural world no biological expertise is assumed of student or instructor Building on a single prerequisite of Precalculus the book suits a two quarter sequence for first or second year undergraduates and meets the mathematical requirements of medical school entry The later material provides opportunities for more advanced students in both mathematics and life sciences to revisit theoretical knowledge in a rich real world framework In all cases the focus is clear how does the math help us understand the science **McGraw-Hill's Top 50**
