

RECONSTITUTION PROBLEM 1

- **Problem:** The doctor orders cefazolin sodium 1 gram IV. The label reads: Add 10 mL of bacteriostatic NaCL to the powdered cefazolin for a concentration of 500 mg per 5 mL. How many mL should the nurse give?
- The key to solving this type of problem is to **ignore extra information that is not necessary to calculate the desired dose**. Then apply the steps for dimensional analysis.
- BL: 1 g
- EL: mL
- CF: 1000 mg = 1 g and 500 mg = 5 mL
- NOTE: The 10 mL of diluent (liquid) is **not necessary** to calculate the dose; only the resulting concentration of the medication (500 mg = 5 mL) is necessary. The concentration means that there is 500 mg of medication in every 5 mL of the added liquid.
- Now setup and solve the equation. Click here for [answer to reconstitution 1](#)

The Nursing Process as a Strategy for a (De-)Professionalization in Nursing Jette Lange, 2024-05-06 The nursing process generally is understood as key element of professional nursing care in Germany This study follows this argument back to the introduction of the nursing process in the 1970s and 1980s At that time the German healthcare system underwent dramatic changes and economic reorganization which can be understood as

the emergence of the neoliberal rationale in Germany The argument of cost explosion was used to restructure hospitals into enterprises that were to operate based on the logic of the market Its cybernetic logic made the nursing process an ideal instrument to restructure nursing care Perspectives of governmentality and critical accounting reveal the nursing process as an accounting tool which has made nursing calculable And while German nurses valued its potential for professionalization the findings suggest that a newly constituted accountable nursing vocation can instead be considered as de professionalizing
