O. Box, 2012-12-06 This study arose out of the old question of what actually determines vegetation structure and distributions Is climate the overriding control as one would suppose from reading the more geographically oriented literature Or is climate only incidental as suggested by more site and or taxon oriented writers The question might be phrased more realistically How much does climate control vegetation processes structures and distributions It seemed to me as an ambitious doctoral student that one way to attempt an answer might be to try to predict world vegetation from climate alone and then compare the predicted results with actual vegetation patterns If climatic data were sufficient to reproduce the world's actual vegetation patterns then one could conclude that climate is the main control This book represents an expanded second generation version of that original thesis It presents world scale vegetation and ecoclimatic models and a methodology for applying such models to predict vegetation and for evaluating model results This approach also provides a means of geographical simulation of vegetation patterns and changes which represent necessary data inputs in other fields such as atmospheric chemistry and biogeochemical cycling It has been fairly well accepted that climatic and other environmental conditions are associated with the evolution of particular aspects of plant form convergent evolution The particular configurations of plant size photosynthetic surface area and structure e g sclerophylly stomatal resistance and their seasonal variations represent what one can recognize fairly readily as distinct growth forms      Popular Photography, 1995-07 *Microbiology Abstracts*, 1975      **Evaluation of Soils and Permafrost Conditions in the Territory of Alaska by Means of Aerial Photographs** Robert E.
