Solar System

The solar system is made up of the sun and all the objects that orbit around it. The sun is the center of the solar system and is a giant ball of hot gas that gives off light and heat. The objects that orbit around the sun are called **planets**, and there are eight of them in our solar system. They are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune.

Mercury is the closest planet to the sun and it's very hot there. **Venus** is the next planet, and it's even hotter than Mercury! **Earth** is the third planet, and it's just the right distance from the sun to support life. **Mars** is the fourth planet and it's often called the "Red Planet" because of its reddish color. **Jupiter** is the fifth planet, and it's the largest planet in the solar system. **Saturn** is the sixth planet, and it's known for its beautiful rings. **Uranus** is the seventh planet, and it's often called the "Ice Giant" because it's mostly made of ice and gas. **Neptune** is the eighth and final planet, and it's known for its strong winds.

In addition to the planets, there are also many other objects in the solar system such as moons, asteroids, comets, and meteors. **Moons** are objects that orbit around planets and some planets have many moons while others have none. **Asteroids** are small rocky objects that orbit around the sun, while **comets** are made mostly of ice and dust and have long tails. **Meteors** are pieces of rock or metal that burn up in Earth's atmosphere, creating the shooting stars that we see at night.

The solar system is a big place and it's estimated that it would take over 100,000 years to travel from one end of the solar system to the other in a spaceship traveling at the speed of light! Even though it's vast, scientists have been able to study it and learn a lot about it using

telescopes, spacecraft, and other tools. They have discovered many
