

Earthquakes & Volcanoes

Did you know the ground your school is located on or the ground you walk on is always moving? You cannot feel the movement, but the Earth's crust is constantly moving throughout the world.

Everything on Earth is located on top of the Earth's **crust**, which is the top layer of the Earth. It moves in some places more often than in other places.

The Earth's crust moves when blocks of the earth slip past one another, which results in an **earthquake**. Earthquakes are related to cracks in the crust called **faults**.

Faults may have formed from an earlier earthquake or while an earthquake is occurring. During an earthquake the crust is in motion on either side or both sides of the fault. The earthquake vibrations travel through the crust.

The farther people are away from the earthquake the harder it is to feel the vibrations. The location below where the earthquake starts is called the **hypocenter**, and the area directly above it on the surface of the earth it is called the **epicenter**. Vibrations can be felt hundreds of miles from the earthquake's epicenter. **Tremors**, small vibrations, can also be felt following an earthquake.
