Protein-Based Materials David Kaplan, Kevin McGrath, 2012-12-06 Nature learned long ago how useful proteins are as a diverse set of building blocks to make materials with very diverse properties Spider webs egg whites hair follicles and skeletal muscles are all largely protein This book provides a glimpse into both nature s strategies for the design and production of protein based materials and how scientists have been able to go beyond the constraints of natural materials to produce synthetic analogs with potentially wider ranges of properties The work presented is very much the beginning of the story Only recently has there been much progress in obtaining a molecular understanding of some of nature s complex materials and the mimicry or replacement of these by synthetic or genetically engineered variants is a field still in its infancy Yet this book will serve as a useful introduction for those wishing to get started in what is sure to be an active and productive field throughout the 21st century The authors represent a wide range of interests and expertise and the topics chosen are comprehensive Charles R Cantor Center for Advanced Biotechnology Boston University Series Preface The properties of materials depend on the nature of the macromolecules small molecules and inorganic components and the interfaces and interactions between them Polymer chemistry and physics and inorganic phase structure and density are major factors that influence the performance of materials *Introduction to Polymer*

Water in Biomechanical and Related Systems Adam Gadomski, 2021-04-21 The contributed volume puts emphasis on a superior role of water in bio systems exposed to a mechanical stimulus It is well known that water plays an extraordinary role in our life It feeds mammalian or other organism after distributing over its whole volume to support certain physiological and locomotive friction adhesion processes to mention but two of them both of extreme relevance Water content not only in the mammalian organism but also in other biosystems such as whether those of soil which is equipped with microbiome or the ones pertinent to plants having their own natural network of water vessels is always subjected to a force field The decisive force field applied to the biosystems makes them biomechanically agitated irrespective of whether they are subjected to external or internal force field conditions It ought to be noted that the decisive mechanical factor shows up in a close relation with the space and time scale in which it is causing certain specific phenomena to occur The scale problem emphasizing the range of action of gravitational force thus the millimeter or bigger force vs distance scale is supposed to enter the so called macroscale approach to water transportation through soil or plants roots system It is merely related to a percolation problem which assumes to properly inspect the random network architecture assigned to the biosystems invoked The capillarity conditions turn out to be of prior importance and the porous medium effect has to be treated and solved in a fairly approximate way The deeper the scale is penetrated by a force exerting and hydrated agent the more non gravitational force fields manifest This can be envisaged in terms of the corresponding thermodynamic non Newtonian forces and the phenomena of interest are mostly attributed to suitable changes of the osmotic pressure In low Reynolds number conditions thus in the sub micrometer distance scale zone they are related with the corresponding viscosity

changes of the aqueous e.g. cytoplasmatic solutions of semi diluted and concentrated but also electrolytic characteristics. For example they can be observed in articulating systems of mammals in their skin and to some extent in other living beings such as lizards, geckos or even insects. Through their articulating devices an external mechanical stimulus is transmitted from macro to nanoscale wherein the corresponding osmotic pressure conditions apply. The content of the proposed work can be distributed twofold. First the biomechanical mammalian type or similar systems with extraordinary relevance of water for their functioning will be presented also including a presentation of water itself as a key physicochemical system medium. Second the suitably chosen related systems mainly of soil and plant addressing provenience will be examined thoroughly. As a common denominator of all of them it is proposed to look at their hydrophobic and or de hydration effects and how do they impact on their basic mechanical and related such as chemo mechanical or piezoelectric etc. properties. An additional tacit assumption employed throughout the monograph concerns statistical scalability of the presented biosystems which is equivalent to take for granted a certain similarity between local and global system's properties mostly those of mechanical nature. The presented work's chapters also focus on biodiversity and ecological aspects in the world of animals and plants and the related systems. The chapters' contents underscore the bioinspiration as the key landmark of the proposed monograph.

In Silico Immunology Darren D.R. Flower, Jon Timmis, 2007-04-16. Whatever its final readership and impact we the Editors feel this book is important. It addresses the realisation that there is a deep and abiding synergy albeit one only now being properly explored and exploited between immunology and computational science. This area of intersection we christen in silico immunology. Immunology is an inspiration for computational scientists seeking practical and philosophical metaphors for their work but at the same time it is itself a biological discipline of such discomfiting complexity that only computational help as different as simulation and data warehousing can make its modern study tractable. Thus immunology both inspires but also requires computational science. This book deals in detail with the three main areas of in silico immunology: theoretical immunology, immunoinformatics and artificial immune systems. While all of these are now well established the interactions between the three are only beginning to be developed. It is a truly exciting time to be working in in silico immunology. We are reaching a critical mass that will enable great strides to be taken and significant achievements to be made. Like David Hume we may yet come to regret that this book falls still born from the press but we hope not. Hopefully it will instead strike a cord and tap into a burgeoning Zeitgeist ready to capitalise on the remarkable potential that is in silico immunology.
