**Autonomous Flying Robots** Kenzo Nonami, Farid Kendoul, Satoshi Suzuki, Wei Wang, Daisuke Nakazawa, 2010-09-15 The advance in robotics has boosted the application of autonomous vehicles to perform tedious and risky tasks or to be cost effective substitutes for their man counterparts. Based on their working environment a rough classification of the autonomous vehicles would include unmanned aerial vehicles (UAVs), manned ground vehicles (UGVs), autonomous underwater vehicles (AUVs), and autonomous surface vehicles (ASVs). UAVs, UGVs, AUVs, and ASVs are called UVs (unmanned vehicles) nowadays. In recent decades the development of manned autonomous vehicles have been of great interest and different kinds of autonomous vehicles have been studied and developed all over the world. In particular UAVs have many applications in emergency situations; humans often cannot come close to a dangerous natural disaster such as an earthquake, a food active volcano, or a nuclear disaster. Since the development of the first UAVs, research efforts have been focused on military applications. Recently, however, demand has arisen for UAVs such as aero robots and ying robots that can be used in emergency situations and in industrial applications. Among the wide variety of UAVs that have been developed, small scale HUAVs (helicopter based UAVs) have the ability to take off and land vertically as well as the ability to cruise in light

but their most important capability is hovering. Hovering at a point enables us to make more effective observations of a target. Furthermore, small scale UAVs offer the advantages of low cost and easy operation.

Se han agregado nuevas tecnologías como las técnicas in vitro y moleculares que parecen acelerar y ampliar de manera clara y notable los resultados del mejoramiento por mutación.
