Daganzo,2012-12-06 This work was stimulated by a comment made by a former student Prof Alan Erera of Georgia Tech in connection with an inventory stabil ity game he was going to play in one of his logistics classes This was the well known beer game that is often played in business schools to illustrate the bullwhip effect in supply chains Al had said to me that he did not have to tell his students how to reorder replacement parts from the other members of the supply chain because he knew from experience that the order sizes the players would generate as the game progressed would become chaotic anyhow Since I had not played the beer game his asser tion was intriguing to me Why would such an unstructured game always lead to the same undesirable effect Did it have something to do with psy chology What is it that players did to generate instabilities I posed these to other people but could not get completely satisfactory an questions swers Thus the bullwhip mystery remained at least in my mind Since inventory chains are conservative systems analogous to a traffic stream and since traffic flow models exhibit similar effects the instability of automobile platoons and of certain numerical methods being two nota ble examples I suspected that traffic flow theory might shed some light on the puzzle      **Advances in Applied Mechanics** ,1997-11-11 This highly acclaimed series provides survey articles on the present state and future direction of research in important branches of applied mechanics      *Cosmic Electrodynamics* Gregory D.
