*The Validity and Reliability of the Wii Balance Board in Community-dwelling Elderly with and Without Balance Impairments* Stacy Bombard, Utica College, 2011. Purpose: To validate the Nintendo Wii Balance Board (WBB) and the Standing Balance and Reach Test (SBRT) and establish their reliability as laboratory and clinical assessment tools for the elderly population. The establishment of the WBB as a valid and reliable tool will allow health care professionals to screen for individuals at risk for falls. Methods: Twenty-nine community-dwelling elderly individuals were categorized into elderly with and without balance impairments using the Activities Specific Balance Confidence Scale (ABC) and the Berg Balance Scale (BBS). Change in COP was assessed in two static standing conditions on both the WBB and force platform (FP) followed by completion of the SBRT. A smaller convenience sample returned to determine the between-day reliability of both the WBB and SBRT. Pearson product bivariate correlation was used to calculate validity and reliability of the WBB and SBRT. Results: The following correlations were found to be significant. There were moderate correlations between FP and WBB on the mediolateral (ML) axis with eyes open ( $p = .001$ ,  $r = .67$ ) and high correlation during eyes closed ( $p = .001$ ,  $r = .73$ ). Test-retest reliability for the WBB in the ML and AP COP sway during same-day trials with eyes open and eyes closed were found to be highly correlated ( $p = .001$ ,  $r = .84$ -.89). Between-day trials for the SBRT were found to be highly correlated ( $p = .001$ ,  $r = .77$ ). The SBRT was found to have a sensitivity of 95% and a specificity of 78% for predicting balance impairments. Conclusion: This study found COP measurements on the WBB to be reliable and valid in specific conditions. The SBRT was found to have validity, reliability, and predictive capability for balance impairment. Future studies will be needed to further validate the findings in a larger sample.
